Water pollution problems due to liquid waste fr the pulp and paper industry and methods of tr ment to alleviate these problems are described specific problem of stream pollution due to wa from a bleached Kraft pulp mill in Alberta presented and the approach used in solving problem outlined. Several methods of treatm were considered including activated sludge, tri ling filters, aerated lagoons and anaerobic lagoo The activated sludge process provided the most liable method of alleviating the problem, but wo have been very expensive. The aerated lagoon t of treatment was considered to have the best pot tial as a technically feasible and economic solut to the problem. (See also W71-04901) (Wooda USGS)

'hemical Engineering, Vol 77, No 20, p 165-168, eptember 21, 1970. 4 p, 3 fig, 3 tab, 13 ref.

escriptors: *Byproducts, *Brines, *Oil fields, Brine disposal, Water reuse, Reclaimed water, esalination, Waste water disposal.
lentifiers: Oil field brines.

ull exploitation of petroleum-associated brines for eir chemicals will benefit the oil producer, the ational economy, and pollution abatement. Sound nservation should favor the recovery of valuable ements from these brines, and with proper anning, the recovery processes should aid in ultiate disposal. A brine must contain a certain nount of recoverable chemicals before it can be nsidered economically valuable, and the further must be pumped, the more chemicals it must conin. Several petroleum-associated brines contain ough sodium for the economical production of dium chloride. This, coupled with the resultant llution reduction and the presence of economic ncentrations of other elements, should make emical recovery from such brines still more atactive. Elements found in economic concentrans include magnesium, calcium, potassium , hium, boron, bromine, and iodine, many of which e now recovered from seawater, salt lakes and bsurface saline waters. EROBIC STABILIZATION OF BEEF EEDLOT WASTE,
exas Tech Univ., Lubbock.
. Grub, J. D. Martin, and L. L. Keeton.
aper presented at the 1970 winter meeting Amerian Society of Agricultural Engineers, Chicago, ecember 8-11, 1970, Paper No 70-909. 6 p.

escriptors: *Anaerobic digestion, *Biological eatment, Farm wastes, Moisture content, Aerobic nditions, Oxygen requirements, Stabilization, itrogen, Waste water treatment.
entifiers: *Composting, *Carbon to nitrogen tio (C/N), Housefly.

olid waste that had accumulated on Southwestern ef cattle feedlots was aerobically stabilized under ntrolled conditions in enclosed digesters and in en air piles. Conditions for stabilization were termined and changes of physical, chemical and ological characteristics were established. The ornic stabilization of beef feedlot waste by comsting is a feasible process. Organic beef feedlot aste is compostable in specially designed digesters in exposed open air piles, to a biologically stable ganic product, free from noxious odors and inset festation. Stabilized waste can be stored in a wet dry state without danger of heating, attracting sects, or causing noxious odors. The time of staization depends on the type of original feed aterial, the condition of the waste at the start of e composting period, and the management of the mposting process. Composting requires skilled anagement to obtain satisfactory results. Christenbury-Iowa State)

AS PRODUCTION FROM BEEF CATTLE ASTES,
exas Tech Univ., Lubbock.
F. Meenaghan, D. M. Wells, R. C. Albin, and W. ub.

Paper presented at the 1970 winter meeting American Society of Agricultural Engineers, Chicago, December 8-11, 1970, Paper No 70-907. 15 p, 9 fig.

Descriptors: *Anaerobic digestion, *Gases, Farm wastes, Chemical oxygen demand, Cattle, Carbon, Nitrogen, Hydrogen, Alkalinity, Methane, Biochemical oxygen demand, Waste treatment, Air pollution, Pollution abatement.
Identifiers: *Composting, *Gas production, Carbon to nitrogen ratio (C/N), Beef cattle, Carbonaceous material, Volatile acids.

A two-stage completely mixed isothermal digestion system having a capacity of 30 gallons/stage was fed wastes from a beef cattle controlled environment chamber. Gas production was monitored and analyzed by a wet test meter and a gas chromatograph, respectively. Physical and bio-chemical tests were also performed. This study indicates that a completely mixed, two stage anaerobic digestion system is technically feasible and can be used for obtaining nominal treatment of beef cattle wastes. Even with optimal conditions per stage such a system will not be sufficient for complete treatment. (Christenbury-Iowa State)

IN VITRO DIGESTIBILITY OF CHEMICALLY-TREATED FECES,
Department of Agriculture, Beltsville, Md. Animal Science Research Div.
L. W. Smith, H. K. Goering, and C. H. Gordon.
Journal of Animal Science, Vol 31, No 6, p 1205-1209, December 1970. 4 tab, 16 ref.

Descriptors: *Digestion, *Chemical degradation, Farm wastes, Ruminants, Fermentation, Cellulose, Costs, Alkalis, Waste treatment.
Identifiers: *Chemically-treated feces, Cell wall, Microbial responses, Oxidants.

Chemical treatment is a means for enhancing the digestibility of the indigestible plant cell wall residues in ruminant feces. Enhanced digestibility was ascertained with detergent solubility methods and in vitro rumen fermentation were obtained through dried chemical degradation of meicellulose, cellulose, and lignin and also through increasing the accessibility of the remaining cell wall for ruminal microbial fermentation. Chemical treatment of indigestible alfalfa or sudax fecal cell walls resulted in greater than 90% digestion (chemical degradation and microbial digestion). This experiment was designed to point out some of the conditions required for maximum chemical hydrolysis and maximum cell wall utilization. Whether or not these conditions can be approximated in feeding trials remains to be demonstrated. (Christenbury-Iowa State)

CATTLE WASTES - POLLUTION AND POTENTIAL TREATMENT,
Kansas Univ., Lawrence. Dept. of Civil Engineering; and Kansas Univ., Lawrence. Environmental Health Engineering Lab.
Raymond C. Loehr, and Robert W. Agnew.
Journal of the Sanitary Engineering Division, ASCE, Vol 93, No SA4, p 55-72, August 1967. 2 fig, 9 tab, 29 ref.

Descriptors: *Farm wastes, *Cattle, *Water pollution sources, Rivers, Fishkill, Moisture content, Biochemical oxygen demand, Chemical oxygen demand, Nitrogen, Anaerobic digestion, Oxygen demand, Lagoons, Hydrogen ion concentration, Effluent, Aeration, Sludge, Runoff, Waste water treatment.
Identifiers: *Feedlots, Cattle production, Pollution potential, Loading rages, Profit potential, Waste characteristics, Total solids, Population equivalent, Digesters, Anaerobic lagoons.

The problem of cattle feedlot waste treatment and the results illustrated in this paper can be summarized as follows: The diversified family farm is giving way to specialized large-scale factory-type operations such as beef cattle feedlots. Farm enterprises which formerly were dispersed over large remote land areas are now concentrated in small areas, frequently near communities, and intensify problems of waste disposal. Runoff from feedlots is a significant problem and treatment systems must be able to handle slug loads and flows without causing stream pollution. The profit potential and the amount of concern of the feedlot operator for adequate waste treatment will dictate the type of system that will be practical and economical. The quantity and the undesirable qualities of the wastes from a beef feedlot are such that a combination treatment system may be the most successful. A combined anaerobic-aerobic lagoon system has significant potential. The effluent from an anaerobic lagoon is potent and must receive further treatment before discharge to a receiving stream. Even after adequate removal of organics, the effluent may pose a problem because of its color and its fertilization capacity. (White-Iowa State)

THE COLLECTION OF MANURE FROM HOUSED LIVESTOCK,
West of Scotland Agricultural Coll., Glasgow (Scotland). Dept. of Farm Buildings.
R. J. Forsyth.
Journal and Proceedings of the Institution of Agricultural Engineers, Vol 21, p 129-133, 1965.

Descriptors: *Farm wastes, *Cattle, Water pollution control, Sludge, Storage capacity, Storage tanks, Waste dilution, Construction materials, Costs, Slurries, Sluice gates, Electric power costs, Rotors, Waste water treatment.
Identifiers: *Dairy cattle, *Oxidation ditch, Slatted floors.

The paper describes collection and handling methods for dairy manure in Scotland. Parlor systems are scarce because of their large bedding requirement. Slatted floors in conjunction with free housing systems has proven highly satisfactory. Different slat types are discussed and evaluated. Under slat tanks or channels are described as well as criteria for dilution, storage capacity, and sluice gates. The possibility of using the Pasveer oxidation ditch is introduced as a result of stringent pollution regulation. Design and costs for the oxidation ditch are presented. A discussion follows the paper. (White-Iowa State)

AEROBIC PURIFICATION OF FARM WASTE,
Rijkszuivel Agrarische Afvalwater Dienst, Arnhem (Netherlands).
H. M. J. Scheltinga.
Journal Proceedings of the Institution of Sewage Purification, p 585-588, 1966. 1 fig, 4 tab, 11 ref.

Descriptors: *Farm wastes, *Hogs, *Biological treatment, Anaerobic digestion, Activated sludge, Rotors, Nitrogen, Biochemical oxygen demand, Chemical oxygen demand, Foaming, Nitrification, Costs, Effluent, Laboratory tests, Ammonia, Waste water treatment.
Identifiers: *Oxidation ditch, Loading rates, Retention time.

Model tests, laboratory investigations, and finally a full scale field experiment with oxidation ditches were carried out in Holland, where an effective and economical waste treatment system is being sought. A 50 per cent BOD reduction was obtained using anaerobic decomposition in the laboratory. Initial and final characteristics of the pig waste are given before and after treatment in the oxidation ditch.

Foaming was excessive from the start. Nitrification played an important part in eliminating the ammonia. Total and expected operational costs are given. (White-Iowa State)

THE BACTERIAL POPULATION OF AN INDOOR POULTRY LAGOON,
Louisiana State Univ., Baton Rouge. Agricultural Experiment Station; and Louisiana State Univ., Baton Rouge. Dept. of Microbiology; and Louisiana State Univ., Baton Rouge. Dept. of Agricultural Engineering; and Louisiana State Univ., Baton Rouge. Dept. of Poultry Science.
Leon J. Cabes, Jr., Arthur R. Colmer, Harold T. Barr, and Benjamin A. Tower.
Poultry Science, Vol 48, No 1, p 54-63, 1969. 2 fig, 3 tab, 17 ref.

Descriptors: *Farm wastes, *Poultry, *Oxidation lagoon, Microorganisms, E. coli, Aeration, Sampling, Coliforms, Bacteria, Pathogenic bacteria, Temperature, Hydrogen ion concentration, Biochemical oxygen demand, Aerobic bacteria, Waste water treatment.
Identifiers: *Laying house, *Bacterial counts, Enterococci, Suspended solids, Manometric studies.

The study was concerned, first, with the enumeration, isolation, and classification of the predominant bacterial flora of an indoor poultry waste stabilization lagoon, and secondly, with an evaluation of this flora to determine the organisms most active in the degradation process. The lagoon consisted of a pit 3 feet 6 inches deep x 13 feet wide x 88 feet long inside a laying house which measured 14 feet x 100 feet. The standard plate counts of aerobic organisms present in the waste water of the lagoon are presented in tabular form. Total solids, pH and BOD reduction data are also presented. The lagoon was aerated with 200 feet of perforated pipe which feed 4 cfm of air at 15 psi. It is felt that additional modifications might be instituted. (White-Iowa State)

LOSSES OF ENERGY AND NITROGEN ON DRYING POULTRY EXCRETA,
Queen's Univ., Belfast (Northern Ireland). Dept. of Agricultural Chemistry.
D. W. F. Shannon, and W. O. Brown.
Poultry Science, Vol 48, p 41-43, 1969. 1 tab, 3 ref.

Descriptors: *Farm wastes, *Poultry, Energy, Nitrogen, Drying, Freeze drying, Vacuum drying, Forced drying, Temperature, Waste treatment.
Identifiers: Kjeldahl nitrogen, Metabolizable energy, Dry matter.

Losses of energy and nitrogen were determined from samples of fresh excreta differing in dry matter and nitrogen content. The samples were dried under the following conditions - freeze drying, vacuum drying at 40C and drying in forced-air ovens at 60C, 100C, and 120C. Nitrogen of the undried and dried excreta was determined by the conventional Kjeldahl method. The mean results of ten energy determinations (%) on fresh excreta samples A and B were 804, 753, 2.51 respectively. The energy losses are in agreement with other authors. From the results of the experiment, the drying temperature should be chosen depending on whether the energy or nitrogen content is more important. In the determination of metabolizable energy, then the method giving lower energy errors would be used. (White-Iowa State)

PHYSICAL AND BIOLOGICAL EVALUATION OF FIVE LITTER MATERIALS,
Purdue Univ., Lafayette, Ind. Dept. of Animal Sciences.
Paul L. Ruszler, and James R. Carson.
Poultry Science, Vol 47, p 1712, 1969.

Descriptors: *Farm waste, *Poultry, *Absorption, Moisture, Particle size, Laboratory tests, Waste water treatment, Waste treatment, Water pollution effects.
Identifiers: *Litter materials, Field conditions, Peanut shells, Pine bark, Ground cobs, Wood shavings, Cane pomace.

The usefulness of peanut shells, pine bark, ground cobs, wood shavings and cane pomace as litter materials in rooster production was evaluated under laboratory and field conditions on the basis of their physical properties and effects on the birds during a 14-week growing period. When the amount and rate of moisture exchange was compared, it was found that all five materials differed significantly. When ranked by grams of moisture absorbed per gram of dry weight, cane was highest, followed by shavings, cobs, shell, and bark. The materials with the smaller particle sizes absorbed less total moisture in both growing house and laboratory tests. The same materials rated low in breast blister incidence, but without statistical significance. (White-Iowa State)

THE DIGESTION OF POULTRY FECES UNDER CAGES,
Auburn Univ., Ala. Dept. of Poultry Science.
J. R. Howes.
Poultry Science, Vol 47, p 1682, 1968.

Descriptors: *Farm wastes, *Poultry, *Aerob conditions, Odor, Aerobic bacteria, Fertiliz Nitrogen, Stabilization, *Waste treatment.
Identifiers: *Absorbent substrate, *Cage operatio *Inoculation, Control plots.

A series of small experiments were carried o under cages with and without concrete floors, usi various absorbent substrates for poultry fece After an initial buildup period, the feces and su strate was inoculated with aerobic bacteria a aerobic conditions maintained by disturbing t surface cake at intervals. These experiments led a field trial without any absorbent substrate at large cage operation in south Florida, which h now been in operation for 18 months. Odors a flies have been largely eliminated except in contr plots and spraying for fly control greatly reduce The bulk of the fecal pile was less than half th volume of the control plots due to stabilization nitrogen and water losses. Feathers were digested they were incorporated into the fecal pile and th resulting material was a homogenous, odorless fe tilizer which has been used in urban gardens and o golf greens. CATALYTIC OXIDATION OF ORGANIC COM POUNDS IN WASTE WATER,
Southern Illinois Univ., Carbondale. Dept. o Chemistry; and Illinois Univ., Urbana. Wate resources center.
Gerard V. Smith, F. Patil, Yuri Pavlov, and Juh V. Chen.
Available from NTIS as PB-197 733, $3.00 i paper copy, $0.95 in microfiche. Illinois Wate Resources Center, Urbana, Research Report N 36, January 1971. 18 p, 7 tab, 2 fig, 9 ref. OWR Project B-022-Ill (1).

Descriptors: *Tertiary treatment, *Waste wate treatment, Municipal wastes, *Organic wastes *Separation techniques, *Oxidation.
Identifiers: *Catalysis, Ultransonic destruction *Catalytic oxidation, Catalytic destruction, *Mu nicipal waste water.

Through studies of the effect of ultrasound on catalysts it has been found that certain water pollutants can be oxidized or modified. This synergetic effect between ultrasound and certain heterogeneous catalysts, sonocatalysis, is demonstrated qualitatively for a number of organic compounds (anilines, stilbestrol, orthochloronitrobenzene and phenol) and quantitatively for the oxidation of iodide ion. The technique shows promise as a tertiary treatment of municipal waste water. (Smith-Illinois)

LD STUDIES ON AN ANAEROBIC LAGOON ATING SLAUGHTERHOUSE WASTE,
ic Health Service, Shiprock, N. Mex.
n E. Enders, Mark J. Hammer, and Clinton L. er.
eedings, Industrial Waste Conference, 22nd, 2, 3, 4, 1967, Purdue University, Vol LII, No 126-137, July 1968. 5 fig, 6 tab.

riptors: *Anaerobic conditions, Anaerobic eria, Lagoons, Temperature, Hydrogen ion entration, Effluents, Dissolved oxygen, mical oxygen demand, Biochemical oxygen de-d, Industrial wastes, *Waste water treatment, dation lagoons.
tifiers: *Slaughterhouse wastes.

ies were performed on anaerobic lagoon waste ment units located in the rural countryside of heast Nebraska to determine their effective-ness in treating slaughterhouse wastes. If designed in accordance with accepted methods, anaerobic lagoons can be used as a first stage treatment and also have the capacity to handle shock loads and intermittent loadings without significant loss of treatment efficiency. The BOD removal during these studies was greater than 980% and solids buildup appeared to be extremely slow. The primary bacterial activity was the conversion of volatile solids to gaseous end products. (Ellis-Texas)

ELIMINATION OF NITRATE FROM AN INDUSTRIAL WASTE,
Badische Anilin- und Soda-Fabrik, A.G., Ludwigshafen am Rhein (West Germany).
Walter Haltrich.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, p 203-210, July 1968. 5 fig, 8 ref.

Descriptors: *Denitrification, *Acitvated sludge, Nitrogen, Nitrite, Nitrates, Biochemical oxygen demand, *Aeration, Sedimentation, Effluent, Organic compounds, Aromatic compounds, Alcohols, Indurstrial wastes, *Waste water treatment, Aerobic conditions, Anaerobic conditions, *Organic wastes, Biological treatment.
Identifiers: Aliphatic compounds, Aldehydes.

Studies were conducted to what effect denitrification can be accomplished in activated sludge. Continuous-flow experiments as well as batch studies were conducted under aerobic and anaerobic conditions. As a result of these experiments it was found that efficient denitrification of an industrial waste can be achieved with the activated sludge process if the nitrate is split in an unaerated stage preceding aeration. If the waste water contains organic impurities (hydrogen donors), denitrification proceeds so rapidly that the dentention time in a plant with denitrification is no greater than a conventional activated sludge plant. (Ellis-Texas)

NEW DEVELOPMENTS IN THE TREATMENT OF METAL FINISHING WASTES BY ION EXCHANGE OF RINSE WATERS,
Bavarian Bureau of Water Supply and Pollution Control, Munich (West German).
Friedick K. Von Ammon.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, p 788-799, July 1968. 6 fig, 4 tab.

Descriptors: *Recirculated water, *Ion exchange, Cation exchange, Anion exchange, Water reuse, Industrial water, Hydrogen ion concentration, Detergents, Costs, Metals, *Waste water treatment.
Identifiers: Metal refinishing, Germany, Rinse water, Cyanide, *Metal finishing wastes.

The advantages and problems of ion exchange and recirculation are discussed from the experiences of three new plants in Germany. The type and situation of the plants, collection of rinse waters, the design and operation of the ion exchange process, the properties of the circulated water, the waste water treatment, the properties of final effluent, and economic considerations are discussed. Recirculation was found to be more economical unless costs for water supply are extremely low or no waste treatment is required. Recirculation results in the reduction in waste quantity which gives obvious advantages for reduced waste treatment and a lower pollution load on receiving waters. (Ellis-Texas)

ACTIVATED SLUDGE TREATMENT OF SOME ORGANIC WASTES,
Water Pollution Research Lab., Stevenage (England).
A. B. Wheatland.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, p 983-1008, July 1968. 14 fig, 8 tab, 2 ref.

Descriptors: *Activated sludge, *Organic wastes, Domestic wastes, Farm wastes, Industrial wastes, Sewage, Biochemical oxygen demand, Aeration, Chemical oxygen demand, *Waste water treatment.
Identifiers: *Contact stabilization, Sludge volume index, Suspended solids.

Four investigations of the suitability of activated sludge or its modifications, in treating waste waters from : (1) the production and dyeing of a synthetic fiber; (2) a mixed effluent from the dyeing of Terylene, Nylon, and polyacrylic fibers; (3) the production of a synthetic rubber; and (4) a partial treatment of dairy effluent. The process can be successfully used for the treatment of waste waters from a variety of industries if suitable conditions are provided for the microorganisms to become acclimatized to the wastes. It may be necessary to dilute the waste water if it contains significant concentrations of potentially toxic or inhibitory organic substances and domestic sewage should be considered as a diluent if the waste water under consideration lacks certain inorganic nutrients or trace elements necessary to enhance treatment. (Ellis-Texas)

USE OF POLYELECTROLYTE COAGULANTS TO ENHANCE SETTLING CHARACTERISTICS OF ACTIVATED SLUDGE,
Weston (Roy F.), Inc., Newtown Square, Pa.
J. F. H. Walker, and J. H. Dougherty.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, p 715-723, July 1968. 6 fig, 1 tab.

Descriptors: *Coagulation, *Activated sludge, Sedimentation, Flocculation, Biochemical oxygen demand, Flotation, *Waste water treatment, Electrolytes, *Settling velocity.
Identifiers: *Polyelectrolytes, Coagulants, Utilization rates, Anionic, Cationic, Nonionic, Agglomeration.

Studies were conducted on 3 anionic, 6 cationic and 3 nonionic polyelectrolyte coagulants to determine their affect as coagulant aids in settling and flocculation of activated sludge. The BOD reaction rates were significantly suppressed with certain polyelectrolyte materials studied and oxygen utilization rates were not significantly affected. No one type of polyelectrolyte was found to be universally effective in increasing the agglomeration and settling rate of activated sludge but, on occasion, sufficient gas entrapment might occur to result in the flotation of sludge flocs. It was determined that polyelectrolyte coagulant aids could be useful in the solution of the settling problems encountered in many waste water treatment plants. (Ellis-Texas)

REGENERATION OF HYDROCHLORIC ACID FROM WASTE PICKLE LIQUOR,
Haveg Industries, Inc., Wilmington, Del.
S. S. Spater.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, p 366-374, July 1968. 9 fig.

Descriptors: *Chemical wastes, Industrial wastes, Corrosion, Adsorption, Turbulence, Phenols, *Waste water treatment.
Identifiers: *Pickle liquor, *Hydrochloric acid, Sulfuric Acid, *Regeneration, Electrostatic precipitator, Turbulator.

The removal of oxide films, or scale, from metal by placing it in an acid bath is known as pickling. Formerly, spent pickle liquor was neutralized and discharged since no process for regeneration of sulfuric acid had been discovered. Increasingly stringent pollution control laws led to investigations into the applicability of hydrochloric acid in place of sulfuric acid in the pickling process. The Haveg Turbulator process is one which can regenerate hydrochloric acid from spent pickle liquor with great efficiency. This process reverses the process of producing FeCl2 from iron oxide and hydrochloric acid with: (1) a high turbulence reactor, (2) an air preheater, (3) and electrostatic precipitator, (4) an adiabatic adsorption column. This process has advantages of: (1) high reaction rates resulting in decreased space requirements, (2) high operating flexibility with very short start-up and shutdown times, (3) low maintenance requirements, (4) actual in-plant operation at present. This system presents an economical alternative to sulfuric acid pickle liquor with its versability and regeneration capability. (Lowery-Texas)

Descriptors: *Industrial wastes, Neutralization, Hydrogen ion concentration, Emulsion, Sedimentation, Sludge disposal, Filtration, *Waste water treatment, Metals.
Identifiers: Non-ferrous metal process waste, Hexavalent chromium, Polyvinyl chloride, Suspended solids, *Metal wastes.

A redrainage and effluent treatment system has been built at the Kynoch Works of Imperial Metal Industries as a result of The Rivers (Prevention of Pollution) Act of 1951. Chemical problems affecting plant design were: (1) Neutralization and pH control; (2) hexavalent chromium concentration determination and treatment; (3) oil separation; (4) sedimentation and (5) sludge disposal. It was decided to allow the effluent to flow by gravity to a central treatment plant which meant redrainage of the entire factory site with polyvinyl chloride. Neutralization was accomplished by a continuous flow system comprising a series of tanks, each pair of which form a pH control stage. After neutralization the effluent is pumped to settling tanks where suspended solids and oil separation is conducted. The sludge is dewatered by vacuum filtration and the filtrate recycled to the wet well at the end of the neutralizing tanks. The instrumentation required for pH control, flow control of lime slurries, a pH recorder, flow-metering and sampling and control of main effluent pumps. (Ellis-Texas)

EFFECT OF CENTRATE FROM SOLID BOWL CENTRIFIUGE ON ACTIVATED SLUDGE PROCESS,
Metropolitan Sanitary District of Greater Chicago, Ill.
Thomas J. Kennedy, and A. J. Kaplovsky.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, p 145-164, July 1968. 11 fig, 8 tab, 25 ref. FWPCA Demonstration Grant WPD 77-01.

Descriptors: *Centrifugation, *Metabolism, Phosphate, Nitrogen, Microorganisms, Coliforms, *Activated sludge, Chemical oxygen demand, Biochemical oxygen demand, *Waste water treatment.
Identifiers: *Sludge Volume Index, *Centrate, Volatile suspended solids, Filamentous organisms.

Two identical activated sludge pilot plants were constructed to study the effects of the recirculation of centrate from a sludge solids bowl-type centrifuge. One of the reactors received centrate, and the other was used as a control. Laboratory analysis determined that the centrate contained mainly generated fines consisting of dissolved zoogloeal masses and fragments of filamentous forms. It was also determined that primary treatment could remove the bulk of centrate solids from centrifugation installations operating at solids recoveries of at least 70%. Centrate solids, obtained from centrifugation of total waste solids output with 80% solids recovery, continuously returned to a conventional activated sludge plant produced no detrimental effects upon effluent quality or the activated sludge process itself. Consistently higher sludge volume indices were noted in the re-cycled reactor, however, but a certain limit was reached beyond which the SVI deteriorated no further. One possible explanation of this phenomena is the breakup of filamentous organisms in the centrifugation process, and their subsequent accelerated cell division and growth when placed in a biologically active reactor. EGG LAYING HOUSE WASTES,
Steeg (Henry B.) and Associates, Inc., Indianapolis, Ind.
Charles F. Niles, Jr.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, p 334-341, July 1968. 1 fig, 2 tab.

Descriptors: *Farm wastes, *Confinement pens, *Forced drying, Incineration, Manure, Fertilizer, Farm lagoons, *Waste water treatment, *Waste disposal.
Identifiers: Carcasses, Laying houses.

The Berry Best Egg Company utilizes 205,000 hens in producing 11,000 dozen eggs per day. These hens produce 41,000 lbs (wet weight) of droppings and an average of 50 dead hens per day. Diposal of the wastes was attempted in a pond system, where vigorous anaerobic digestion ensued along with danger of flooding of recreational areas. Alternative methods of treatment which were investigated were: (1) solids drying; (2) controlled anaerobic digestion; (3) land disposal; (4) incineration; (5) aerobic treatment; (6) sedimentation; (7) centrifugation; and (8) hydroponic agriculture. Solids drying was selected as the optimum system for this operation. New solids collecting devices were installed to minimize the water used for collection. 40,000 gpd of water had previously been used for cleaning and solids carriage. A Badger Barn Cleaner conveyor was used to carry the wastes from a central dump station to the dryers. The solids were fed in automatically while hen carcasses were placed on by hand to equalize the load. The solids were ground in a hammermill, dryed, and either bagged for sale as fertilizer, or collected for land disposal. At the present time, the system is still in the initial shakedown period and no definite results on loadings and efficiencies have been obtained. However, it is thought that this process holds much promise for this type of operation in the future. (Lowry-Texas)

Identifiers: *Polyelectrolyte, Suspended soli Outboard motors, Rubicon River, Hartford (Wis

All outboard motors produced by the Chrysler C poration Outboard Engine plant must be tested i tank to determine whether or not they are prope assembled and ready for sale. These engines run an oil-gas mixture, and an oil film builds up on surface of the test tank. To keep this oil from p manently marking the engines an emulsifier added. All other wastes streams could be econo cally handled except this one. Suspended sol content of the test tank could range as high as 10 mg/l. Because of the scarcity of cheap water it w decided that this water should be recycled throu the cooling towers and finally back to the test ta The only treatment method which could reduce t oil content, and at the same time not remove corrosion inhibitor which must be present safeguard the plant was an anionic polymer in co bination with a bentonite clay. The chemicals a added to influent which is mixed with air und pressure. The waste stream is released to a flotati tank, and as the floated floc comes to the surface is skimmed off as scum. The clarified process wa is then recycled through the plant. The quality the water is not sufficiently high to allow dire discharge to a receiving stream, but in this ca recycle is both desirable and economical. (Low Texas)

TREATMENT AND DISPOSAL OF EFFLUEN FROM A 450 TON PER DAY KRAFT PULP AN PAPER MILL INTO CLASSIFIED INLAN WATERS,
New Zealand Forest Products Ltd., Tokoroa.
J. L. Vickerman.
Proceedings, Industrial Waste Conference, 22n May 2, 3, 4, 1967, Purdue University, Vol LII, N 3, July 1968, p 968-982. 8 fig, 1 tab.

Descriptors: *Water purification, *Pulp and pap industry, Pulp wastes, Wood wastes, Effluents, I dustrial wastes, Sedimentation, Seepage, Soil pr perties, Soil texture, Costs, *Waste water trea ment.
Identifiers: Waikato River, New Zealand, Clarifie

Although the Kinleith Mill suffers from the disa vantage of discharging into New Zealand's longe and most utilized inland waterway, it is endowe with two natural advantages: (1) a considerab potential for purification inherent in the 360 ft. fa of the effluent stream to the Waikato River; an (2) a gopography and soil suited to a good volum of seepage disposal. To treat this effluent they hav constructed two sewer systems: (1) the stronger e fluents gravitate from the mill site through an ope channel for over a mile where they enter a sed mentation pond into a seepage pit, and then into pond for retention and controlled discharge on seasonal cycle; and (2) a system that flows throug a primary clarifier located adjacent to the mill an then discharges to a stream course which ever tually flows to Maretai Lake and classified water The operating cost per ton of pulp is about 68 cent while the unit capital cost per annual ton of pulp $4.23. TREATMENT OF WASTES ORIGINATING FROM METAL INDUSTRIES,
Emschergenossenschaft, Essen (West Germany).
A. Montens.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, July 1968, p 908-925. 16 fig, 1 tab, 12 ref.

Descriptors: *Industrial wastes, Metals, *Waste water treatment, Emulsions, Sedimentation, Neutralization, Ion exchange, Crystallization, Salts, Acids.
Identifiers: Cleaving, Hot-rolling-mills, Pickling plants, Regeneration, *Metal wastes.

The wastes of the metal industry, the treatment of wastes of hot-rolling-mills, of pickling plants, and the treatment of aged oil emulsions, including a short look at combustion plants were discussed. The treatment of wastes from hot-rolling-mills involves cleansing the liquid of scale and oil. This is conventionally done by mechanically cleaned settling tanks. Neutralization, ion exchange, regeneration, and crystallization were methods discussed for the treatment of pickling wastes. The treatment of oil emulsions consists of two steps: (1) the cleaving of emulsions, and (2) the separation of oil. Cleaving the oil emulsion can be done by various processes: (1) adding of salts; (2) adding of acids; (3) adding of salts and heating of the emulsions; (4) adding salts and treatment by electricity; and (5) adding of acids and organic cleaving agents. POULTRY PROCESSING WASTE TREATMENT AT MILLSBORO, DELAWARE,
Syracuse Univ., N.Y. Dept. of Civil Engineering.
Nelson L. Nemerow.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, July 1968, p 526-536. 4 fig, 4 tab, 1 ref.

Descriptors: *Poultry, *Oxidation lagoons, *Organic loading, Algae, Ammonia, Sedimentation, Flotation, Biodegradation, Chlorination, Coliform, Bacteria, Biochemical oxygen demand, Delaware, *Waste water treatment.
Identifiers: Millsboro (Delaware), Swan Creek, Indian River.

9,000 to 10,000 chickens with an average weight of 3.75 lbs are processed during an 8-11 hour working day at Millsboro, Delaware. The wastes from this operation are treated in a two stage oxidation pond with effluent chlorination. Samples were collected in April, June, and December of 1966, and March of 1967. The BOD loading was found to be 1390 lbs/day, with a loading on the first pond of 935 lb BOD/acre. This pond effected a 72.5 percent reduction in BOD. The second pond had a loading of 79 lb BOD/acre, with an additional BOD reduction of 9.5% when algae are not removed from the effluent, and 70% when algae are removed. The overall removal, based on the 4 samples per year, was 92% for the filtered effluent, and 75% when the algae are not filtered out. (Lowry-Texas)

WASTE TREATMENT FOR AN AUTOMATED GRAY NODULAR IRON FOUNDRY,
Caterpillar Tractor Co., Peoria, Ill. Design and Construction Div.
A. J. Bader, and C. L. Meyer.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, July 1968, p 468-476. 3 fig, 1 tab.

Descriptors: *Iron, Aeration, Sedimentation, Coagulation, Flotation, Neutralization, Weirs, Chlorination, Biochemical oxygen demand, *Waste water treatment, Illinois, Industrial wastes.
Identifiers: Mapleton (Ill), *Foundry, *Contact stabilization comminution, American Petroleum Institute Gravity Separator, Prefabrication, Lift station.

Caterpillar Tractor Company has designed a new foundry which will utilize water for cooling, dust collection, and a variety of other uses. This plant provides for separation of all difficult to treat waste streams. Oil is burned off in a 'chip dryer', and the remaining wastes are channeled into a batch unit which allows the operator the convenience of determing optimum conditions for each batch. The usual treatment is sedimentation, neutralization, and flotation. Careful control on the part of the operators is necessary in order to maintain the high effluent quality of which the equipment is capable, necessitating the employment of capable dependable operators. A detailed description of both the plant processes and the waste water treatment is included. (Lowry-Texas)

DISPOSAL OF EFFLUENTS FROM PETROLEUM REFINERIES AND PETROCHEMICAL PLANTS,
Bayerische Biologische Verouchsaustalt, Munich (West Germany).
Lothar Huber.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, July 1968, p 1009-1024. 6 fig, 3 tab, 10 ref.

Descriptors: *Oil wastes, *Oil, Activated sludge, Effluents, Separation techniques, Oily water, Oil industry, Fuels, Reclamation, Recirculated water, Hydrogenation, Aeration, Coagulation, Waste disposal, Waste water treatment.
Identifiers: *Petrochemicals, Aerated lagoons.

Full integration of in-plant procedures and multistage waste water treatment combined with re-use and reclamation of purified water at five newly constructed petroleum refineries in West Germany has led to considerable progress in pollution abatement. Use of hydrogenation processes, application of improved chemical processes, extensive use of air-cooled heat exchangers, and recirculation have decreased the water treatment and water intake of the plants. Application of pretreatment steps such as stripping, evaporation, equalization of flow, oil separation, and strength of waste waters in skim and surge tanks are practiced. Use of multi-stage biological treatment consisting of low-rate activated sludge plant and an aerated lagoon with a detention time of two days is used. Chemical coagulation can be performed in a separate unit or in the aeration tank of the activated sludge plant for added precipitation. The treatment principles developed in these refineries are being applied in the waste water treatment at a petrochemical plant. (Ellis-Texas)
W71-05015

THE LANCY INTEGRATED SYSTEM FOR TREATMENT OF CYANIDE AND CHORMIUM WASTES IN ELECTROPLATING PLANTS,
Shakespeare Co., Kalamazoo, Mich.
Neal Schreur.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, July 1968, p 310-316. 1 fig, 1 tab.

Descriptors: *Chromium, Industrial wastes, Carbonates, Effluents, Hydrogen ion concentration, Costs, Waste water treatment.
Identifiers: Lancy Integrated System, *Cyanide, *Electroplating.

The Shakespeare Company has effectively used the Lancy Integrated System to treat their effluent from plating operations at several plants. This is not an expose on the Lancy system since this system has been reviewed in prior publications but describes the operation at Shakespeare's Kalamazoo Division. A closed loop system is used incorporating the cyanide system, the Chrome I system, and the Chrome II system. The Cyanide system is used following all cyanide bearing baths. The Chrome I system is used primarily for the reduction of hexavalent to trivalent chrome. The Chrome II system is used to polish off any remaining hexavalent chrome and to precipitate the trivalent chrome as a carbonate. (Ellis-Texas)

FIXED ACTIVATED SLUDGE PROCESS FOR INDUSTRIAL WASTE TREATMENT,
Kurita Central Labs., Yokohama (Japan).
K. Kato, and Y. Sekikawa.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, July 1968, p 926-949. 17 fig, 6 tab, 14 ref.

Descriptors: *Activated sludge, *Industrial wastes, *Waste water treatment, Aeration, Sedimentation, Sludge, Domestic wastes.
Identifiers: *Fixed activated sludge process, Sludge bulking, Japan.

A series of experimental studies have been conducted to maintain a relatively constant sludge concentration by fixing the suspended flocs of activated sludge on the meshwork of plastic net panels arranged vertically in the aeration tank. This modification is used to prevent sludge bulking and is known as the 'Fixed Activated Sludge Process.' Experiments were conducted on domestic sewage, waste water discharged from a soft-drink bottling factory, and petrochemical wastes from iso-butanol and octanol plants. The FAS process is not only an improvement of the activated sludge process but is also the development of a new unit process of biochemical aeration. (Ellis-Texas)

COAL MINE DRAINAGE TREATMENT,
Jones and Laughlin Steel Corp., Pittsburg, Pa.
E. F. Young, Jr., and H. E. Steinman.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, July 1968, p 477-491. 15 fig, 7 tab.

Descriptors: *Acid mine water, *Coal mine wastes, *Mine drainage, *Hydrogen ion concentration, Acidity, Alkalinity, Neutralization, Chemical precipitation, Slurries, Sedimentation, Oxidation, Hydrolysis, Iron, Water table, Pennsylvania, *Waste water treatment, Industrial wastes.
Identifiers: *Yellowboy, Hydrated lime, Holding lagoon, Jones and Laughlin Steel Corporation.

Mine drainage is an extremely variable and complex situation. Discharges analyzed here range from very alkaline to very acidic, from iron contents far beyond the allowable limits to iron contents just above the allowable limits, and so on. Realization that each situation is a separate entity and must have treatment tailored specifically for its needs is essential. Discharges, flow rates, chemical analyses, and treatment methods for several different mine drainage problems encountered by the Jones and Laughlin Steel Corporation are presented here. (Lowry-Texas)

WASTE CONTROL AND TREATMENT BY A CORN AND SOYBEAN PROCESSOR,
Staley (A. E.) Mfg. Co., Ill.
R. V. Willenbrink.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, July 1968, p 517-525. 4 fig.

Descriptors: *Corn (Field), *Soybeans, Monitoring, Stabilization, Aeration, Activated sludge, *Waste water treatment, Illinois.
Identifiers: *Process wastes, Population equivalent, Contact stabilization.

Staley's program to reduce the sewer loss of materials has cost the company $150,000 per year in the past two years. Monitoring and waste treatment, two separate phases of the overall program have reduced the daily waste discharge by 50,000 population equivalents/operating day. The three basic components are: (1) careful monitoring for quick isolation of problem areas; (2) efficient waste treat-

ment for concentrated process waste; and (3) support of the management. A thorough explanation of the entire system and the managerial attitudes is included. (Lowry-Texas)
W71-05019

CENTRIFUGES FOR PAPER MILL WASTE SLUDGE DEWATERING,
Mead Corp., Chillicothe, Ohio. Central Research Lab.
W. C. Matthews, George H. Andrews, and John K. Sullins.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, July 1968, p 325-333. 5 fig, 3 ref.

Descriptors: *Centrifugation, *Gravity, *Dewatering, Abrasion, *Pulp wastes, Flocculation, Vacuum drying, Oxidation lagoons, Biochemical oxygen demand, Waste water treatment, Ohio.
Identifiers: *Clarification, *Recovery, Hydraulic loading, Detention time, Cyclone cleaner, Suspended solids, Fly ash, Bar screen, Grinder.

Centrifuges have been previously used successfully in the paper industry for solids concentration. They have been used by The Mead Corporation both for dewatering and for recovery of materials such as lime. Solids recovery and discharge solids are functions of: (1) character of the waste, (2) the feed rate, (3) the feed consistency, (4) pond depth, and (5) bowl speed. Feed rates of up to 300 gpm have been handled without flooding, with the optimum being approximately 100 to 150 gpm. Sludge cake averages 40% solids, with solids recovery approaching 90% of the feed. Suspended solids and BOD removals are in excess of 80% and 40% respectively. Problems have been encountered from the standpoint of longevity of the equipment. Grit and fly ash tend to produce excessive wear at speeds for which the centrifuges were designed. Reduction of centrifuge speed necessarily reduces the efficiency of the operation as a whole. Future developments in the field may include new materials used for their wear resistant properties, pretreatment by cyclone cleaners for abrasive removals, or centrifuges in series, each one operating at successively higher speeds causing the abrasive materials to be removed at the slow speeds with a minimum of equipment wear. (Lowry-Texas)

THE DU PONT WASTE LIQUOR PROCESS,
du Pont de Nemours (E. I.) and Co., Wilmington, Del. Industrial and Biochemicals Dept.
Ralph Aarons, and Robert A. Taylor.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, July 1968, p 120-125. 5 fig, 1 tab.

Descriptors: *Industrial wastes, *Waste water treatment, *Lime, Steam, Air, Temperature, Hydrogen ion concentration, Gypsum, Waste disposal, *Neutralization, *Oxidation, Iron compounds, Delaware.
Identifiers: Pickle, Waste pickle liquor process, Magnetite.

The problem of disposal of waste liquor produced when sulfuric acid is used to clean, or 'pickle' steel has been solved by the du Pont Company. This process involves continuous neutralization with lime and sinultaneous oxidation of soluble iron to insoluble magnetic iron oxide which provide high-density, low-volume granular solids which are easily separated and disposed of. Gypsum is also produced by this process and has been preliminarily evaluated by a leading manufacturer of wall board and found to be useable. This process is in operation at two steel mills with several more units in the design or construction stage. (Ellis-Texas)
W71-05021

FLUIDIZED-BED PROCESSES - A SOLUTION FOR INDUSTRIAL WASTE PROBLEMS,
Copeland Process Corp., Oak Brook, Ill. Engineering Dept.
John E. Hanway, Jr.
Proceedings, Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol LII, No 3, July 1968, p 183-193. 10 fig, 1 tab.

Descriptors: *Industrial wastes, *Pulp and paper industry, Steel, Effluents, Water pollution, Air pollution, Incineration, *Oxidation, *Waste water treatment, Illinois.
Identifiers: *Fluidized-bed process, *Copeland process.

The successful application of the Copeland Process to the treatment of waste effluents from the paper and pulp industry to eliminate stream pollution is described and additional applications have been outlined. Fluidized-Bed Processes represents not only a method to prevent stream pollution, but also a treatment which allows for possible substantial and economic recovery of pulping chemicals. Any waste product containing a combustible constituent represents a promising candidate for the fluidized-bed process. Oxidative processes, by combustion as in the fluidized-bed processes, convert pollution-causing constituents of our wastes into innocuous gases and inert solids which do not cause water or air pollution. OAHU WASTE WATER TREATMENT PLANT EFFICIENCY,
Hawaii Univ., Honolulu. Dept. of Environmental Health and Sanitary Engineering.
Reginald H. F. Young, and P. L. Chan.
Journal Water Pollution Control Federation, Vol 42, No 12, December 1970, p 2052-2059. 5 tab, 7 ref.

Descriptors: *Hawaii, *Waste water treatment, Activated sludge, Trickling filters, Chlorination, Disinfection, Lipids, Phosphorus, Nitrogen, Biochemical oxygen demand, Hydrogen ion concentration, Temperature, *Treatment facilities, Hawaii.
Identifiers: *Extended aeration, Suspended solids, Septicity, Oahu (Hawaii).

Waste treatment plants in Hawaii are currently employing primary and primary plus secondary treatment in the form of either trickling filters or activated sludge. Suspended solids removals, BOD5 removals and chlorine residuals all fall with the operational percentage limits reported by other authors for trickling filters and activated sludge and chlorination. At present, there are no facilities for either nitrogen or phosphorus removal, the excess of which is discharged to the effluent. (Lowry-Texas)

USE OF STYROFOAM FOR TRICKLIN FILTER COVERS,
Dow Chemical Co., Midland, Mich. Plastics Dept.
J. P. Sheahan.
Proceedings, Industrial Waste Conference, 20t May 4, 5, 6, 1965, Purdue University, Vol XLI No 4, July 1965, p 572-582. 11 fig, 2 tab.

Descriptors: *Trickling filters, Odor, Fog, Freez ing, Roofs, Construction, Costs, Aesthetic *Waste water treatment, Biochemical oxygen d mand, Michigan.
Identifiers: *Styrofoam, *Spiral generatio Midland (Mich).

A comparison of the efficiencies of covered versu uncovered trickling filters was made by the Do Chemical Company. It was found that there wa some increase in efficiency but not enough to justi fy covering the trickling filters. Other advantages t covering trickling filters are prevention of freezing odor control, fog control, lessen the spread of filte flies, and improve appearance. The main disad vantage to covering a trickling filter is the excessiv cost which is in the range of $2.75-5.00 per squar foot of plan area. (Ellis-Texas)

George J. Capestany, and Dale A. Carlson.
Proceedings, Industrial Waste Conference, 21st, May 3, 4, 5, 1966, Purdue University, Vol L, No 2, March 1966, p 943-952. 8 fig, 11 ref.

Descriptors: *Proteins, *Aminoacids, *Biodegradation, Protozoa, Rotifers, Pre-Treatment (Water), Colorimetry, Chromatography, Oxidation, Carbon, Nitrogen, Microorganisms, *Activated sludge, Waste water treatment, Washington.
Identifiers: *Keratins, Hair, Disulfide bonds, Flagellates, Amoebas, Sodium hydroxide, Seattle (Wash).

Protein from mammalian hair, hooves and nails, bird feathers, and reptile scales all falls within the general classification of keratins. Keratins are insoluble in hot water, organic solvents, dilute bases and acids, and are resistant to digestion by pepsin and trypsin. Keratin has a high sulfur content in the form of disulfide bonds, forming a dihedryl bond angle of 90 deg and having a bond energy of 60 k cal/mole. To prepare the keratin for testing, it was dissolved in sodium hydroxide to make it available to the microorganisms for biodegradation, sodium hydroxide being tested against other solvents and found to be the best. Results showed considerable variation in the types of microorganisms which were present under different loadings of keratin, but they also showed conclusive evidence that keratin could feasibly be biologically degraded. rcity of land in the highly industrialized Europe-country of West Germany has necessitated the struction of petrochemical complexes im-diately adjacent to or within heavily populated as. In view of this fact, increasingly strict air and er pollution laws have been necessary. The rochemical industries have responded to this ation with a concentrated effort to: (1) reduce volume of water used; (2) find ways of re-using er from various processes in other processes; (3) segregate the waste streams so that each te may be treated in the most efficient manner sible. The areas of greatest effort deal mainly n waste oil and phenols and the methods used in oving or destroying them. The methods used include gravity separation of oil, flotation/floc-ation, and finally biological treatment. (Lowry-as)

Proceedings Industrial Waste Conference, 21st, May 3, 4, 5, 1966, Purdue University, Vol L, No 2, p 480-494, March 1966. 4 fig, 3 tab, 1 ref.

Descriptors: *Chemical wastes, Sewage, Permits, Flocculation, Filters, Coagulation, Alkalinity, Oil Biochemical oxygen demand, Phosphate, Effluents, *Oil wastes, *Waste water treatment, Costs, Treatment facilities, Standards.
Identifiers: Petrochemical wastes, Gravity separator (API), Latex, Butadiene, Styrene, Ethylene, Gas wastes, South Africa, *Treatment standards, *Combined treatment.

Segregation of storm water and spent cooling water from oil polluted waste streams has significantly reduced treatment costs and increased plant efficiency for a South African Petrochemical Plant. The addition of flocculation facilities has greatly enhanced treatment efficiency in the case of oil and latex polluted waters. A complete description of the geographical location sewer systems, primary and secondary treatment facilities, and effluent discharge constraints is presented. At present, this complex is operating within or nearly within the governmental constraints, but increasingly higher effluent quality standards may soon necessitate further updating of, and addition to the treatment facilities. SODIUM HYDROXIDE RECOVERY IN THE TEXTILE INDUSTRY,
Buenos Aires Univ. (Argentina).
Carlos S. Carrique, and Luis U. Jauregui.
Proceedings Industrial Waste Conference, 21st, May 3, 4, 5, 1966, Purdue University, Vol L, No 2, p 861-868, March 1966. 4 fig, 1 tab.

Descriptors: *Textiles, *Industrial wastes, Hydrogen ion concentration, Alkalinity, Color, Turbidity, Filtration, Sedimentation, Flotation, Evaporation, Waste water treatment, *Water reuse, Sodium compounds, Costs, Evaporators.
Identifiers: Castelar Textile Mill, Caustic soda, Concentration, Dyeing, Bleaching, Desizing, Mercerizing, Buenos Aires, Argentina, *Sodium hydroxide, *Recovery costs.

High treatment costs for sodium hydroxide effluents, and high replacement costs for sodium hydroxide itself necessitated construction of a system to segregate the sodium hydroxide waste stream and reclaim the sodium hydroxide. This decision was made by an Argentine textile mill, and it resulted in decreased chemical costs both for alum coagulation and neutralization, and it was more economical to reclaim the sodium hydroxide than to replace it. The total net gain is approximately 35 to 40 thousand U. S. dollars per year for a firm handling about 2000 metric tons of cotton per year. The system devised consists of evaporative concentration combined with filtration. Problems were encountered in the original single effect system because the recovered product had a strong color and could not be used for recycle. Also, the use of caustic soda in the plant occasioned many corrosion problems. The addition of a second evaporator, working under a vacuum, made the process a double effect evaporator, and provided both more complete and more efficient treatment of the caustic soda solution. This unit provided re-use of heat from the single effect evaporator, permitted the collection of sodium hydroxide free of color, and avoided the serious corrosion problems. (Lowry-Texas)

REMOVAL OF COD FROM WASTE WATER BY FLY ASH,
Cincinnati Univ., Ohio. Dept. of Civil Engineering.
Prodip K. Deb, Alan J. Rubin, Arthur W. Launder, and K. H. Mancy.
Proceedings Industrial Waste Conference, 21st, May 3, 4, 1966, Purdue University, Vol L. No 2, p 848-860, March 1966. 9 fig, 12 ref.

Descriptors: *Adsorption, *Fly ash, *Activated carbon, Feasibility studies, Pilot plants, Coagulation, Sedimentation, Separation techniques, Hydrogen ion concentration, Biochemical oxygen demand, *Chemical oxygen demand, Ohio, Waste water treatment.
Identifiers: *Refractory materials, Coagulant, Teflon, Hamilton County (Ohio).

Much research on adsorption has been performed recently with activated carbon. However, because of the excessive cost and lack of regeneration procedures for activated carbon, much interest has been developed in a cheaper adsorbent. A comparison of activated carbon versus fly ash, a disposal problem for many coal burning industries, was conducted. The adsorptive properties of activated carbon are far superior to any other commercially available adsorbent, but economic analyses showed that while initial capital costs would be 15% greater, largely due to increased thickener sizes, the long term operating costs for the fly ash plants would be approximately 1/7 of the cost of activated carbon. The capacity of fly ash to remove refractory materials both in batch and continuous flow systems was well demonstrated in this study. The three major system parameters, mixing time, initial COD, and concentration of fly ash were logarithmically related to COD removal. The addition of a small amount of activated carbon significantly enhanced the adsorptive capacity of the mixture. Further studies should be made on a much larger scale to adequately determine the feasibility of fly ash utilization, with respect to its adsorptive capacity, and also the disposal problems associated with the fly ash sludge. PLATING AND INDUSTRIAL WASTE TREATMENT AT THE FISHER BODY PLANT,
General Motors Corp., Warren, Mich. Fisher Body Div.
Raymond Fisco.
Water and Sewage Works, 1970 Reference Number, Vol 117, p R236-239, November 28, 1970. 4 p, 4 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Industrial water, *Water management (Applied), *Lake Erie, Methodology, Planning, Chromium, Water pollution, Streams, Sludge treatment, Acids, Alkalinity, Neutralization, Treatment facilities, Water quality, Water utilization, Chemicals, Reclaimed water, Effluents.
Identifiers: *Fisher Body (Elyria, Ohio plant).

The Fisher Body, Elyria, Ohio plant is a major manufacturer of hardware and electroplated parts for the automobile industry. The treatment plant effluent now averages 1.5 mgd. This discharges into a large storm sewer which in turn joins the Black River one mile east of the plant and is approximately one-fourth mile upstream from Cascade Park. Inasmuch as the Fisher Body effluent flows to a surface stream, the plant is required to operate under the provisions of a permit from the Ohio Water Pollution Control Board at Columbus. The raw waste flow may be described as rather weak solutions of acid or alkali and various suspensions incidental to this type of manufacturing. The flow-through ver-

sus batch-type waste treatment is compared. The importance of segregation of the various types of wastes is emphasized. The flue gas method of chrome waste scrubbing has proven highly effective at this plant. Surveillance and continuous monitoring are likewise extremely important. A valuable adjunct to the system is an aquarium receiving flow from the final effluent stream. (Woodard-USGS)

PROCESS CONTROL TECHNIQUES FOR TREATING ACID MINE-POLLUTED WATERS,
Battelle Memorial Inst., Columbus, Ohio. Environmental Systems Div; and Battelle Memorial Inst., Columbus, Ohio. Chemical Process Development Div.
Syed R. Qasim, Ira L. Whitman, and Robert F. Testin.
Water and Sewage Works, 1970 Reference Number, Vol 117, p R240-R245, November 28, 1970. 6 p, 6 fig, 3 tab, 7 ref.

Descriptors: *Waste water treatment, *Acid mine water, *Industrial wastes, *Appalachian Mountain region, *Water management (Applied), *Industrial water, Mine drainage, Mining, Water pollution, Streams, Mine wastes, Chemicals, Methodology, Water quality, Reclaimed water, Effluents, Acids, Neutralization, Alkalinity, Ion exchange, Chemical analysis, Data collections, Surface waters.

The generalized curves and procedure presented in this paper can be applied to control the chemical feed rates and regeneration cycle of the ion-exchange resin beds in various treatment processes in municipal and industrial water treatment plants which process acid mine polluted waters. The procedure is quite simple since pH and specific conductance are the only parameters required for applying the curves developed in this paper. These can be monitored continuously, thereby eliminating the need for frequent chemical tests to adjust the chemical feed rates. The process of adjusting the chemical feed rates and resin beds regeneration cycle can be computerized, giving a completely automated system. (Woodard-USGS)

Descriptors: *Distillation, *Flotation, *Separation techniques, Saturation, Coagulation, Pressure, Phosphates, Turbulence, Turbidity, Dissolved oxygen, Chemical oxygen demand, Biochemical oxygen demand, Pilot plant, Biodegradation, *Waste water treatment.
Identifiers: *Soluble organics, Particulates, Alum, Ferric chloride, Suspended solids.

The technical and economic feasibility of the separation of organic materials and other contaminants from primary and secondary sewage effluent by a foam fractionation-flotation process was studied. Air-waste water mixtures were held at pressures above 150 psi for from 6 to 25 minutes and then bled to a release vessel where pressures were reduced to atmospheric. Soluble organic and particulate matter collected at the bubble-water interfaces of the fine bubbles being evolved from the supersaturated liquid. Effects of varying flow rate, pressure, contact time, and of different release vessels and additives were studied. 70%, 90%, and 40-80% reductions of COD, phosphates, and suspeneded solids were effected at optimum conditions of air-to-water volume ratios of 2.17 to 1, pressures greater than 175 psi, and with 300-400 mg/l alum or ferric chloride as coagulants. Estimated costs, exclusive of chemicals were 5 cents/1000 gallons for a 10 mgd plant. (Lowry-Texas)

Descriptors: *Activated carbon, *Chemical treatment, Coagulation, Sewage treatment, Pilot plant, Adsorption, Biochemical oxygen demand, *Waste water treatment.
Identifiers: *Clarification, Expanded-bed, Packed-bed, Total organic carbon.

A comparison was made of expanded-bed and packed-bed modes of operation of activated carbon adsorption systems in the direct physico-chemical treatment of raw sewage and primary effluent. This project involved extended field testing of a pilot scale treatment system of chemical clarification followed by adsorption. The expanded-bed and packed-bed modes of operation demonstrated essentially equivalent removal of organic matter from the chemically clarified effluent. When a 24 ft. settled depth of activated carbon was used, both systems consistently produced a clear, treated water with an average organic content of only 3-5 mg/l, measured either as TOC or BOD. The expanded bed mode offered several advantages: (1) it eliminates plugging or fouling with particulate matter and air binding; (2) feed pressure remains constant and maintenance requirements are minimal; and (3) it provides an opportunity for a degree of natural aeration. Estimated cost for treating raw waste water in a 10 MGD plant by this process is about 20 cents per 1000 gal. with a total estimated investment of $4,000,000.(Ellis-Texas)

ULTRAFILTRATIVE DEWATERING OF SPENT POWDERED CARBON,
Amicon Corp., Lexington, Mass.
C. W. Desaulniers, and R. W. Hausslein.
Copy available from GPO Sup Doc as I67.13/4:ORD17020 DBA 03/70, $0.70; microfiche from NTIS as PB-197 865, $0.95. Water Pollution Control Research Series, ORD 17020 DBA 03/70, March 1970. 68 p. FWQA Program 17020 DBA.

Descriptors: *Membranes, *Dewatering, *Activated carbon, *Slurries, Shear, Flocculation, Pressure, Separation techniques, Solids content process, Cost analysis, Tertiary treatment, *Waste water treatment.
Identifiers: *Ultrafiltration, Flux, Secondary effluent, Polyelectrolytes.

Spent powdered activated carbon from secondary effluent treatment has been successfully dewatered by continuous membrane ultrafiltration. 5 and 10% carbon solids concentration slurries, using a laboratory size thin channel (0.1 sq ft membrane area), have been dewatered by continuous ultrafiltration to solids levels of 25 to 30%. Dewatering rates ranged between 50 and 100 gal/sq ft per day transmembrane pressures of from 10 to 50 psi during runs as long as 9 days, and product water was invariably free of any syspended carbon solids. T cost of membrane ultrafiltration depends upon membrane life, and at membrane flux rates of gal/sq ft per day the cost of dewatering carbon fr 10 to 20% solids is $0.0015 per pound of carb with a membrane life of six months, and $0.00 per pound with a membrane life of only one mon At the present no conclusive data on membrane is available, but estimates of between 1 and months are quite common and seen to be reasor ble. EXTREME REMOVALS OF SUSPENDED SOLIDS AND BOD IN TANNERY WASTES BY COAGULATION WITH CHROME TAN DUMP LIQUORS,
Maine Univ., Orono. Dept. of Civil Engineering.
O. J. Sproul, K. Keshavan, and R. E. Hunter.
Proceedings, Industrial Waste Conference, 21st, May 3,4,5, 1966, Purdue University, Vol L, No 2, March 1966, p 600-612. 5 fig, 4 tab, 8 ref.

Descriptors: *Biochemical oxygen demand, *Coagulation, Lime, Sulfides, Water utilization, *Waste water treatment.
Identifiers: *Tannery wastes, *Suspended solids.

Design criteria was developed for a treatment plant for a chrome tanned cattleskin tannery waste that maximized the removal of suspended solids in addition to BOD removal. A change from the dehairing process utilizing a high lime sulfide to one using a proprietary unhairing compound with less lime and sulfide reduced the total plant BOD and suspended solids by 25 and 45%, respectively. Tests on the plant as it was before and after modification revealed that equalization of plant flows and utilization of the coagulating action of chrome dump wastes gave SS and BOD removals of up to 99 and 50%, respectively, after settling of the waste. W71-05163

THE ROLE OF PHOSPHATE IN THE ACTIVATED SLUDGE PROCESS,
Ontario Research Foundation, Toronto. Dept. of Applied Microbiology.
Lorne A. Campbell.
Proceedings, Industrial Waste Conference, 21st, May 3,4,5, 1966, Purdue University, Vol L, No 2, March 1966, p 214-225. 2 fig, 6 tab, 12 ref.

Descriptors: *Phosphates, *Activated sludge, *Sewage, *Microorganisms, Flocculation, Biological oxidation, *Waste water treatment.
Identifiers: Dispersed growth, Canning wastes, Milk wastes, Metabolites.

An investigation was made of why activated sludge functions as it does. The fact that it does function is an anomoly and is an apprent contradiction of the theory of catalysis. Experimental studies of the effect of yeast extract, glucose, urea, phosphate, amino acids, glutamate, and trace nutrients on dispersed growth of sewage microorganisms were conducted. The results of this study explains why a difficulty is experienced in treating milk plant wastes and vegetable canning plant wastes by orthodox activated sludge procedures. This study, in conjunction with other substantiating research, permits the postulation of the following hypothesis: activated sludge flocs function as reservoirs of metabolites essential to dispersed growth of sewage microorganisms. (Ellis-Texas)

EXTENDED AERATION ACTIVATED SLUDGE TREATMENT OF PETROCHEMICAL WASTE AT THE HOUSTON PLANT OF PETRO-TEX CHEMICAL CORPORATION,
Petro-Tex Chemical Corp., Houston, Tex.
R. D. Pruessner, and J. Mancini.
Proceedings, Industrial Waste Conference, 21st, May 3,4,5, 1966, Purdue University, Vol L, No 2, March 1966, p 591-599. 3 fig, 3 tab, 10 ref.

Descriptors: *Activated sludge, *Aeration, Pilot plants, Costs, Anaerobic conditions, Sludge, Biochemical oxygen demand, Chemical oxygen demand, *Oil wastes, *Waste water treatment, Oxidation lagoons, Texas.
Identifiers: Extended aeration, Suspended solids, Volatile suspended solids, Houston (Tex).

Laboratory units consisting of continuous flow activated sludge units to provide a rapid evaluation of gross loading and toxicity information, and batch temperature studies were conducted. Two pilot plants consisting of a conventional activated sludge and an extended aeration activated sludge unit were also operated to provide a basis for our final waste treatment plant design. The extended aeration activated sludge treatment unit proved to be the most efficient and removes about 99% of the BOD from the waste stream in a stable system which requires about 3 hours per day operator time. It was also found that the use of an anaerobic pond is an economical method of sludge disposal. (Ellis-Texas)
W71-05167

EFFECT OF ORGANIC WASTE WATER AND COOLING WATER ON SELF-PURIFICATION OF WATER,
Technische Hochschule, Aachen (West Germany).
Botho Bohnke.
Proceedings, Industrial Waste Conference, 22nd, May 2,3,4, 1967, Purdue University, Vol LII, No 2, July 1968, p 752-770. 23 fig, 20 ref.

Descriptors: *Cooling water, *Waste water treatment, *Self-purification, Aeration, Reaeration, Water purification, Industrial wastes, Oxygenation, Organic wastes, Organic loading.
Identifiers: *Lippe River, Lippe Association, Lippeverband, Artificial aeration.

A discussion of the problems involved in the reoxygenation of the Lippe River in West Germany is presented. Analyses of oxygen diagrams at a given load showed that the influence of biologically degradable industrial waste water and the discharge of cooling water exerted on the self-purification capacity of the Lippe River can be estimated with satisfactory accuracy for long stretches of the river. The method of calculating the influence of organic loads on the process of self-purification has proved a valuable help in establishing economical improvement schemes in specific treatment measures, and in fixing contributions. An artificial aeration system was used to maintain the biological balance of this river until adequate treatment facilities could be constructed. (Ellis-Texas)

EFFECTS OF REFRIGERATED STORAGE ON THE CHARACTERISTICS OF WASTE,
San Jose State Coll., Calif. Dept. of Civil Engineering and Applied Mechanics.
F. J. Agardy, and M. L. Kiado.
Proceedings, Industrial Waste Conference, 21st, May 3,4,5, 1966, Purdue University, Vol L, No 2, March 1966, p 226-233. 3 fig, 3 tab, 8 ref. Public Health Service Training Grant 1T1-WP-66-02.

Descriptors: *Refrigeration, *Cooling, *Freezing, Preservation, Water analysis, Storage, Chemical oxygen demand, Biochemical oxygen demand, Respiration, Waste water treatment.
Identifiers: Warburg respirometer, Suspended solids, Volatile suspended solids.

Studies were initiated to determine the effect of refrigerated storage, freezing, and the length of storage under these conditions on standard analyses carried out on wastes. Total solids, suspended solids, volatile suspended solids, COD and BOD were measured at time equals 0, 1 day, and 7 days and only the total solids concentration remained uneffected. A large increase in suspended solids and volatile suspended solids as a result of freezing is a clear indication of the colloidal nature of many waste constituents. A Warburg respirometer was used to investigate the changes in BOD rate constants and ultimate first stage BOD values. (Ellis-Texas)
W71-05169

MODEL OF THE COMPLETELY-MIXED ACTIVATED SLUDGE PROCESS,
Texas Univ., Austin. Dept. of Civil Engineering.
Tom D. Reynolds, and J. T. Yang.
Proceedings, Industrial Waste Conference, 21st, March 1966, Purdue University, Vol L, No 2, March 1966, p 696-713. 8 fig, 7 tab, 6 ref.

Descriptors: *Activated sludge, Respiration, Sludge, *Sewage treatment, *Waste water treatment.
Identifiers: Complete mix, Recycle, Continuous flow, Endogenous respiration, Sludge yield.

A laboratory model was operated to determine the design parameters involved in a completely mixed activated sludge process. The data from the continuous flow unit without recycle fitted the straight line forms of the equations developed which indicated that the equations derived in this study were correct. Equations were developed for MLVSS concentration, the detention time required, the oxygen uptake rate, and an adjustment to laboratory endogenous respiration rates. The design parameters of the sludge yield coefficient and the endogenous respiration rate can be determined from continuous flow laboratory units without recycle or from batch laboratory units using parent sludge from a continuous flow activated sludge unit. The batch tests are to be

preferred because these tests are much quicker and accurate results are obtained from batch tests with much less difficulty than from the continuous flow tests without recycle. (Ellis-Texas)

A MULTI-STAGE FERMENTATION SYSTEM FOR FUNDAMENTAL ANAEROBIC DIGESTION RESEARCH,
British Columbia Research Council, Vancouver.
Frank D. Schamburg, and Edwin J. Kirsch.
Proceedings, Industrial Waste Conference, 21st, May 3, 4, 5, 1966, Purdue University, Vol L, No 2, March 1966, p 368-380. 4 fig, 2 tab, 13 ref. Public Health Service Grant WP00760-01, Public Health Service Fellowship 5-F1-WP-22, 348-01.

Descriptors: *Anaerobic digestion, *Methane bacteria, *Fermentation, *Alcohols, Escherichia coli, Metabolism, Cultures, Aluminum, Stainless steel, Cellulose, Temperature, Hydrogen ion concentration, Microorganisms, Waste water treatment.
Identifiers: Methanobacillus omelianski, Dead space, Short-circuiting, Interaction, Teflon.

The mechanisms of the anaerobic digestion were studies by culturing the individual organisms which are present in anaerobic digestion. A multi-stage fermenter, the details of which are presented, was used to grow a pure culture of Methanobacillus omelianski. This bacillus was chosen more for convenience than for being representative of the methane formers. Much additional work is needed to build an improved multi-stage fermenter and to grow bacteria which are more representative of the total system and study the interactions between them. (Lowry-Texas)
W71-05173

A FIELD STUDY OF THE EXTENDED AERATION PROCESS,
Cincinnati Univ., Ohio.
James J. Westrick, James M. Morand, and David J. Eye.
Proceedings, Industrial Waste Conference, 21st, May 3, 4, 5, 1966, Purdue University, Vol L, No 2, March 1966, p 424-439. 6 fig, 3 tab, 12 ref.

Descriptors: *Design criteria, *Activated sludge, *Ammonia, *Nitrogen, Oxidation, Rotifers, Protozoa, Sedimentation, Organic loading, Chemical oxygen demand, Biochemical oxygen demand, Waste water treatment, *Aeration.
Identifiers: Extended aeration, Detention time, Hydraulic loading, Sludge handling.

Two extended aeration plants were operated and monitored by qualified research personnel. As a result of this experiment, it was discovered that state standards for construction of these installations will result in under designed plants. Also, it was previously thought that these installations required little or no maintenance. This research established the fact that constant and vigilant professional control is essential to the efficient operation of an extended aeration plant. (Lowry-Texas)

AGRICULTURAL AMMONIA FOR STUCK DIGESTERS,
Washington State Univ., Pullman. Div. of Industrial Research.
Fred Cooper, Ervin Hinden, and Gilbert H. Dunstan.
Proceedings, Industrial Waste Conference, 20th, May 4, 5, 6, 1965, Engineering Bulletin of Purdue University, Vol XLIX, No 4, July 1965, p 126-130. 2 tab, 10 ref.

Descriptors: *Anaerobic digestion, *Ammonia, *Organic acids, *Alkalinity, Methane bacteria, Metabolism, Fermentation, Methane, Temperature, Hydrogen ion concentration, Microorganisms, Waste water treatment.
Identifiers: *Distressed digester, Gas production.

The addition of anhydrous ammonia to stuck digesters to restore favorable microbiological condition has become increasingly popular. While lime may in some cases even favor increased production of volatile acids, anhydrous ammonia does not. Anhydrous ammonia is also more economical in many areas. The conditions leading to digester distress in Pullman, Washington, the remedial action taken with anhydrous ammonia, and the results of this action are presented. Anhydrous ammonia, in this instance, provided virtually complete recovery in 11 days. It must be noted, however, that the appropriate dosage must be carefully calculated and applied in order for this method to be of assistance. (Lowry-Texas)
W71-05175

THE TREATMENT AND DISPOSAL OF RADIOACTIVE WASTES IN AN INDUSTRIAL LABORATORY PLANT,
Farbwerke Hoechst, Frankfurt am Main (West Germany).
Hans Gotte, and Josef Talsky.
Proceedings, Industrial Waste Conference, 20th, May 4, 5, 6, 1965, Purdue University, Vol XLIX, No 4, July 1965, p 504-516. 9 fig, 3 tab.

Descriptors: *Radioactivity, *Radioisotopes, Water pollution treatment, Tritium, Decomposition, Waste dilution, Incineration, Chemical precipitation, Slurries, Filters, Plastics, Pesticides, Solvents, *Waste water treatment.
Identifiers: *Radiochemistry, Carbon-14, Iodine-131, Short-life, Long life, Flume hoods, Carcasses, Dyestuffs, Petrochemicals, Pharmaceuticals, Synthetic fibers.

Radiochemical wastes from one of the largest chemical companies in the Federal Republic of Germany are treated in a centralized treatment plant. Contaminated substances include wash water from hygenic showers, equipment washwater, laboratory animal carcasses, and inlet and outlet air filters. Individual treatment processes for each of these waste sources are discussed, with emphasis placed upon the uniqueness of each situation, and the corresponding necessary to evolve a specialized treatment process for each specialized waste. DEHYDROGENASE ENZYME AS A PARAMETER OF ACTIVATED SLUDGE ACTIVITIES,
Texas Univ., Austin.
Davis L. Ford, J. T. Yang, and Wesley W. Eckenfelder.
Proceedings, Industrial Waste Conference, 21st, May 3, 4, 5, 1966, Purdue University, Vol L, No 2, March 1966, p 534-543. 9 fig, 1 tab, 5 ref.

Descriptors: *Enzymes, *Activated sludge respiration, Incubation, Organic compounds, Temperature, Hydrogen ion concentration, Waste water treatment.
Identifiers: *Dehydrogenase, Sludge age.

Preliminary tests in the laboratory and in the field indicate that dehydrogenase measurement is potentially a valuable analytical tool. According to the literature and laboratory observations by the authors, cellular dehydrogenase activity is directly associated with its growth phase while this activity and respiration rates follow the same kinetics. In biochemical metabolic pathways, organic compounds are broken down through a series of dehydrogenations which can measure the enzymes by using a tetrazolium salt such as TTC as the hydrogen acceptor. CENTRIFUGAL DEWATERING OF PRIMARY PAPER INDUSTRY SLUDGES,
National Council for Stream Improvement, Corvallis, Oreg.
R. O. Blosser, and A. L. Caron.
Proceedings, Industrial Waste Conference, 21st, May 3, 4, 5, 1966, Engineering Bulletin of Purdue University, Vol L, No 2, March 1966, p 450-456. 9 fig, 1 tab, 2 ref.

Descriptors: *Dewatering, Pilot plant, Retention, *Sludge, Costs, Pulp and paper industry, *Pulp wastes, Coagulation, *Waste water treatment.
Identifiers: *Centrifugal, Vacuum treatment.

Extensive pilot plant work and field installations have revealed some of the factors which affect the efficiency of sludge dewatering such as: (1) bowl speed, (2) detention time in the bowl; and (3) feed sludge consistency. The advantages of the equipment described are: (1) it required little supervision; (2) it is capable of handling wide variations in fed sludge consistency; (3) has a low space requirement; (4) it eliminates the need for chemical conditioning; and (5) the costs are competitive with vacuum filtration. Limitations observed were that trash in the form of chips and sticks cannot be handled and flow rates must be held at a low level on gpm to horsepower ratio to obtain satisfactory solids recovery. REGIONAL WASTE WATER MANAGEMENT SYSTEMS,
Massachusetts Univ., Amherst.
R. J. Giglio, D. D. Adrian, F. C. Kaminsky, and R. F. Rikkers.
In: The Proceedings of the Jerusalem International Conference on Water Quality and Pollution Research, p 229-239, June 1969.

Descriptors: *Water quality standards, Decision-making, Mathematical model, Interceptors, Optimization, Stochastic process, Biochemical oxygen demand, Non-linear programming, Economies of scale.
Identifiers: *Waste water treatment systems, Regional planning, Stream vector, System network, Cost function, Cost effectiveness.

The research described is directed toward the development of a methodology and mathematical model to aid planning agencies in regional waste water management. The waste water management system is viewed as a set of subsystems models with unique characteristics. The most basic subsystem is the sewage source or flow with an associated stream vector. The treatment plants of the primary, secondary and tertiary variety are the second subsystem. Other subsystems to be considered are the system network or interceptors connecting treatment plants and sewage sources and the river effluent. The major emphasis is on the manner in which elements of the stream vector change from an input of a subsystem to an output of that system. The author uses economic data on construction and operating costs for waste treatment facilities assuming economies of scale. Results of the work on subsystems determine which plans are feasible subject to cost constraints. A region in Massachusetts has been selected for a pilot study of this model. (Siegenthaler-Rutgers)

TREATMENT OF EFFLUENTS BY ELECTROLYTIC METHODS IN BRITAIN,
M. R. Hillis.
Water and Pollution Control, Vol 108, No 12, p 22-27, December 1970. 6 fig, 9 ref.

Descriptors: *Electrolysis, *Ion transport, *Oxidation-reduction potential, Anodes, Cathodes, Phenols, Copper, Flotation, Toxicity, Electrochemistry, Industrial wastes, Sewage treatment, Waste water treatment, Effluents.
Identifiers: *Great Britain, Pickle liquor, Photographic wastes, Plating wastes.

Electrolysis for treatment of industrial effluents was practiced before 1900 but was abandoned because the technology was not advanced far enough. At the present time, electrolytic treatment is proving extremely beneficial, mainly due to increased technology and experience in the area, to

ndustrial applications involving ions or ion com-lexes which are toxic to conventional treatment ystem bacteria. Examples of both recovery and euse of valuable materials, and complete destruc-on of unrecoverable materials are presented. (El-s-Texas)

entifiers: *Biological luxury uptake, *Calcium ecipitation, *Calcium phosphate entrapment, arbon dioxide stripping, Phosphorus assimilation, gglomeration, Sludge volatility, Suspended solids, lling Road Plant, San Antonio (Tex).

ctivated sludge must contain 2-3% phosphorus by eight in order to grow. Phosphorus removals in cess of this level are caused by chemical ecipitation with the phosphate being entrapped the sludge floc and carried along with it. ecipitation is dependent on sewage pH, which is turn dependent upon CO2 concentration. If at me point along the length of the aeration basin e DO and pH rise, then precipitation will occur th a resulting phosphorus removal. This enomena is not dependent upon the conven-nal operational parameters such as organic load-g and mixed liquor suspended solids. (Lowry-xas)

REATMENT OF SHIPBOARD WASTES,
ew Mexico State Univ., University Park. Dept. of vil Engineering.
hn W. Hernandez, Edward T. Kinney, and rold H. Singerman.
oceedings, Industrial Waste Conference, 21st, ay 3, 4, 5, 1966, Purdue University, Vol L, No 2, 80-891, March 1966. 3 fig, 3 tab, 7 ref.

escriptors: Water pollution sources, *Design ndards, *Coliform, *Chlorination, Disinfectant, ak discharge, Electrochemistry, Biological treat-nt, Biochemical oxygen demand, *Waste water atment.
entifiers: Warships, Small craft, *Shipboard vage, Flush water, Maceration, Suspended ids, Thermal solids destruction, Electrochemical ids destruction.

val vessels of the United States Navy, commer-l vessels, and private pleasure crafts can no ger be ignored as pollution sources in coastal ters. An interagency committee within the deral government has proposed shipboard treat-nt requirements. Between 10 and 20 gpd of ste per man are produced on ships following a rmal work load, as reported by a shipboard waste vey. The maximum flow can be from 200 to 0% of the average flow. Shipboard evaluations of nacerator-chlorinator established the feasibility using a single unit for multiple fixtures. Data in-ates that a substantially coliform-free effluent be expected, if available chlorine is maintained ve 1300 mg/l/flush. (Lowry-Texas)

OTATION OF OILY WASTES,
bil Oil Co., Trenton, Mich.
lph E. Quigley, and E. L. Hoffman.
oceedings, Industrial Waste Conference, 21st, y 3, 4, 5, 1966, Engineering Bulletin of Purdue University, Vol L, No 2, p 527-533, March 1966. 3 fig, 4 ref.

Descriptors: *Flotation, *Oil wastes, *Flocculation, Separation techniques, Sedimentation, *Waste water treatment, Lime, Costs.
Identifiers: API separator, Alum.

A general discussion of the theory of primary separation, air flotation, and flocculation of oily wastes is conducted. The waste water system in use at the Trenton Refinery is described along with the results of operation. Flocculation increases the efficiency of the flotation process and alum or lime have given significant improvements in the oil-water separation process. The operating costs of the waste water system have varied but a typical cost would be about 11.5 cents per 1000 gallons. (Ellis-Texas)

PRECIPITATION OF HIGH DENSITY METALLIC HYDROXIDES FOR RECOVERY OR DISPOSAL,
Infilco, Tucson, Ariz.
R. R. Evans.
Proceedings, Industrial Waste Conference, 21st, May 3, 4, 5, 1966, Purdue University, Vol L, No 2, p 511-515, March 1966. 2 fig, 2 tab.

Descriptors: *Chemical precipitation, Metals, *Sludge, *Dewatering, *Waste water treatment.
Identifiers: *Metal hydroxides, DENSATOR, Clarifier.

In an effort to produce a dense, easily dewatered metal hydroxide sludge, INFILCO has developed a proprietary process by the techniques which they have used successfully to produce high density calcium carbonate and magnesium hydroxide sludge in water treatment. INFILCO believes the DENSATOR clarifier incorporates the following principles to an unprecedented degree: (1) it insures completion of the precipitation reaction; (2) it is easily controlled; (3) it produces minimum sludge volume; and (4) it produces a less hydrous sludge which is easily dewatered. (Ellis-Texas)

APPLICATION OF INDUSTRIAL PHOTOSYNTHESIS PROCESS TO WASTE WATER RENOVATION SYSTEMS,
North American Aviation, Inc., El Segundo, Calif. S and ID Life Sciences.
R. H. T. Mattoni, H. Nugent Myrick, and E. C. Keller, Jr.
Proceedings, Industrial Waste Conference, 20th, May 4, 5, 6, 1965. Engineering Bulletin of Purdue University, Vol XLIX, No 4, p 684-705. 17 fig, 1 tab.

Descriptors: *Algae, *Biomass, Water purification, *Protozoa, *Fungi, *Bacteria, Hydrogen ion concentration, Temperature, Alkalinity, Bicarbonates, Bactericide, Kinetics, Hardness, Coliforms, Cytological studies, Evaporation, Microorganisms, California, *Photosynthesis, Waste water treatment.
Identifiers: Industrial photosynthesis, Mean doubling time, Packed cell volumes, Bacterial plate counts, Lancaster (Calif).

Industrial photosynthesis refers to the controlled growth of complex populations of microorganisms, mainly unicellular algae, on complex organic substrates such as primary and secondary waste waters. The goal of this process is to produce salable biomass in addition to increasing the water quality to levels acceptable for irrigational or recreational uses. Three full-scale tank reactors were used to perform experiments on selection processes, pH dependence, and temperature dependence. The natural selection of a simple array of species from a complex seed was demonstrated. pH, however, was shown to have little effect on the relative species frequency profiles. It was also determined that when reactors are operated in an identical fashion, they do produce identical populations of microorganisms. The experiment was situated in an area known for high temperature and cloud free days. During the experiment, however, the region was experiencing its annual temperature minimums, with ice forming on the tops of the reactors. In spite of this, growth rates obtained were comparable to growth rates during the spring, summer, and autumn, demonstrating these systems to be applicable even where freezing temperatures are encountered during part of the diurnal cycle. Finally, the final reductions of bacteria were shown to be a function of algae growth. This was attributed to bacteriocidal enzymes excreted by the algae. (Lowry-Texas)

TRACE METALS AND FILAMENTOUS MICROORGANISM GROWTH,
Kansas Univ., Lawrence. Environmental Health Engineering Lab.
John T. Pfeffer, Aziz A. Samra, and Diann T. Schwegler.
Proceedings, Industrial Waste Conference, 20th, May 4, 5, 6, 1965, Purdue University, Vol XLIX, No 4, p 608-617, July 1965. 5 fig, 5 tab, 15 ref.

Descriptors: *Trace elements, *Microorganisms, Molds, Bacteria, Sludge water analysis, Water chemistry, Water properties, *Waste water treatment.
Identifiers: Filamentous fungi, Sludge bulking.

An investigation of the chemical environment as related to solubility and to the growth characteristics of filamentous microorganisms as related to the presence of trace metals was conducted. As a result of these experiments and literature search it was found that the trace metal requirements for filamentous fungi are different from bacteria and when the trace metal required for bacterial growth is missing, fungi can predominate with sludge bulking occurring. Good fungal growth was obtained in glucose with only iron or zinc present while the presence of copper tended to retard fungal growth. The chemical environment is quite important in controlling the availability of trace metals. (Ellis-Texas)

A FIELD COUNTERCURRENT EXTRACTOR FOR WATER POLLUTANTS,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio.
Robert L. Bunch, and M. B. Ettinger.
Proceedings, Industrial Waste Conference, 20th, May 4, 5, 6, 1965, Purdue University, Vol XLIX, No 4, p 93-97, July 1965. 2 fig, 1 tab, 1 ref.

Descriptors: Water pollution, *Separation techniques, *Solvent extractions, Pumps, Pressure, Organic matter, Chemical oxygen demand, *Waste water treatment.
Identifiers: Countercurrent extractor, Contactor.

A complete portable liquid extractor has been fabricated for recovering organic pollutants from surface waters. A precise description of these organic pollutants is necessary if we are to deal effectively with today's complex pollutional problems. Most organic pollutants occur in minute concentrations and some means of concentrating these materials is necessary before analysis and identification can be made. Direct solvent extraction would add substantially to the present capability for isolating contaminants from surface water. Podbielniak, Inc. of Franklin Park, Illinois, has fabricated an extractor with necessary pumps, flow meters, pressure gauges, and other accessory equipment mounted on a 6 ft x 10 ft skid which will be mounted on a 14 ft stake bed truck and a separate truck will carry the generator and the solvent to give a completely portable, self-contained unit that can be operated at almost any location. This unit should find use in extracting carcinogenic polynuclear hydrocarbons and pesticides, and in capturing 'slug' doses of organic pollutants in river water. (Ellis-Texas)

PLASTIC TRICKLING FILTER--ACTIVATED SLUDGE TREATMENT OF PAPER WASTES,
Tufts Univ., Medford, Mass. Northeast Research Center.
R. H. Follett.
Proceedings, Industrial Waste Conference, 20th, May 4, 5, and 6, 1965, Purdue University, Vol XLIX, No 4, p 120-125, July 1965. 4 fig.

Descriptors: *Trickling filters, *Activated sludge, *Pulp wastes, *Pulp and paper industry, *Filters, *Organic loading, *Waste water treatment, Solids contact process, Biochemical oxygen demand.
Identifiers: Plastic trickling filter, Loading, Hydraulic load.

A pilot plant implementing the subject process was operated over a two-year period, treating settled effluent from a fine papermill, boardmill, and a papermill employing deinking, the effluent from the latter contained the discharge from both the pulp and the papermills. The pilot plant consisted essentially of those units that are inherent to the activated sludge and trickling filter processes. The combination system provides improved performance, reduced costs and improved settleability. The trickling filter could be used as a cooling tower to cool hot waste to a degree that is amenable to treatment by the activated sludge unit. Operating costs would probably be somewhat lower since the reduction in the aeration power requirement may be greater than the power differential for raising the return sludge to a greater head. The greatest advantage of the combined system appears to be the uniformity of performance at high loading rates. (Ellis-Texas)

LOW PRESSURE WET AIR OXIDATION OF SEWAGE SLUDGE,
Sterling Drug, Inc., Rothschild, Wis. Zimpro Div.
G. H. Telezke.
Proceedings, Industrial Waste Conference, 20th, May 4, 5, 6, 1965. Purdue University, Vol XLIX, No 4, p 40-48, July 1965. 7 fig, 4 tab, 1 ref.

Descriptors: *Pressure, *Temperature, *Oxidation, *Sewage sludge, Filtration, Sands, Filters, Chemical oxygen demand, *Waste water treatment.
Identifiers: Nonputrescible, Sterile, Residue, Specific resistance value.

Low-pressure wet air oxidation provides an economical and flexible method of producing a sterile, readily drainable, and completely acceptable end product for ultimate disposal. The objective of the Zimpro sludge treatment is to produce such a product which is easily concentrated to the minimum volume consistent with the lowest overall treatment and disposal cost. High temperatures (300-400F) and variable pressure (150-3000 psi) are used in this process. Low specific resistance values are indicative of a sludge with rapid characteristics and Swanwick, et al, have made many measurements and determined that the specific resistance value must be reduced to at least 40 x 10 to the 7th power sec sq/g for various sludges. The sludges under wet air oxidation showed x values mostly around 10 x 10 to the 7th power sec sq/g. The low pressure unit should prove to be applicable for the great majority of installations in the U. S. (Ellis-Texas)

ION FLOTATION FOR INDUSTRIAL WASTES: SEPARATION OF HEXAVALENT CHROMIUM,
Illinois Inst. of Tech., Chicago. Dept. of Civil Engineering.
R. B. Grieves, T. E. Wilson, and S. CM. Schwartz.
Proceedings, Industrial Waste Conference, 20th, May 4, 5, 6, 1965. Purdue University, Vol XLIX, No 4, p 110-119, July 1965. 6 fig, 2 tab, 10 ref.

Descriptors: *Chromium, *Foam separation, *Surfactants, Foam fractionation, Separation techniques, Foaming, Tertiary treatment, *Waste water treatment, Industrial wastes, Ions.
Identifiers: EHDA, Bromine, *Chromates, *Dichromates, Concentration, Batch feed, Continuous feed, *Ion flotation.

The objective of this investigation is the establishment of the feasibility of ion flotation (foam separation) for the separation of hexavalent chromium from aqueous solution, using a cationic surfactant which would form an insoluble complex with the dichromate ion. With batch operations, lower residuals of dichromate and of surfactant were obtained than with continuous operation. For continuous operation at a detention time of approximately 150 minutes, a 50 milligram per liter feed stream of dichromate could be split via ion flotation into a foam stream containing 450 milligrams per liter of dichromate and a residual stream containing 15 milligrams per liter of dichromate. The flow rate of the residual stream would be 92% of the feed stream. Greater reductions in the residual dichromate could be achieved by multicolumn operation and by variations in operating variables. (Ellis-Texas)

AUTOXIDATION OF WOOD DISTILLATION WASTES WITH OXYGEN,
Florida Univ., Gainsville. Dept. of Environmental Engineering.
Boyd T. Riley, Jr., John E. Kiker, Jr., and Charles I. Harding.
Proceedings, Industrial Waste Conference, 21st, May 3, 4, 5, 1966. Purdue University, Vol L, No 2, p 926-942, March 1966. 9 fig, 1 tab, 7 ref.

Descriptors: *Acidic water, *Toxicity, Kinetics, Chemical oxygen demand, Phenols, Biological treatment, Chemical degradation, Chromatography, Industrial wastes, Waste water treatment, *Oxidation, *Pulp wastes.
Identifiers: *Autoxidation, Chain reactions, Parr reactor, Antioxidants, Destructive distillation, Charcoal, Retort.

Wood distillation wastes have resisted both biological and chemical treatment. Such wastes have COD's of approximately 100,000 mg/l, a pH of 2-3, and an extremely dark color. While biological treatment is possible, it is not economically feasible, nor is iron coagulation, lime neutralization coagulation following chlorination, extraction, or direct application to unpaved roads. Because air and oxygen are relatively abundant and inexpensive compared to the chemicals needed for some of the other methods, autoxidation was selected as a likely treatment method. Experiments showed temperature to be the most important factor in establishing the rate and completeness of an autoxidation reaction. The first test performed was only of limited success yielding a dilution figure of 1:90 as opposed to 1:100 for the raw waste. The temperature and the pressure were then increased to 260C and 100 psi respectively. The volume of reactor for the first test was 67 liters, and for the second test it was 1.86 liters. This smaller volume had a much higher mixing level, which partially accounted for a conversion rate of 230 mg/l min in the small reactor as opposed to 20 to 30 mg/l min in the larger reactor. As much as 80% treatment of the waste was observed in a period of 10 minutes, while tripling the reaction time increased the percentage to only 87%. The attinability of removals of this range showed that autoxidation of wood wastes does offer considerable promise of being an excellent treatment method for wood distillation wastes. (Lowry-Texas)

tions, Anaerobic conditions, Aerobic bacteria, Dis
solved oxygen, Carbon cycle, *Biochemical oxyge

demand, Chemical oxygen demand, Energy, *Waste water treatment, *Oxidation lagoons.
Identifiers: *Caloric energy.

Laboratory studies were made in an attempt to describe the degree and type of treatment afforded by an anaerobic-aerobic lagoon system and compare it with the treatment provided by the more widely used aerobic facilities. Parameters investigated include BOD, COD, total caloric energy, and organic solids. The results of testing these parameters indicated that the aerobic cell gave better and more complete treatment than the anaerobic-aerobic series. It was shown during this investigation that BOD is not the best indicator of the amount of organic degradation accomplished within such systems and that another parameter is needed to support BOD data. USE OF OXYGEN IN SLUDGE STABILIZATION,
Union Carbide Corp., Tonawanda, N. Y.
H. Bruemmer.
Proceedings, Industrial Waste Conference, 21st, May 3, 4, 5, 1966. Purdue University, Vol L, No 2, p 544-558, March 1966. 6 fig, 7 tab, 18 ref.

Descriptors: *Oxygen, *Sludge, *Sludge treatment, Sludge disposal, Nitrogen, Phosphorous, Aerobic conditions, Biota, Chemical oxygen demand, Biochemical oxygen demand, *Waste water treatment, Aeration.
Identifiers: *Stabilization, Total solids, Volatile solids.

Studies were conducted in the laboratory using batch and draw-fill types of treatment systems to compare the use of oxygen with air in the aerobic stabilization of sludge. As a result of these experiments it was found that the use of oxygen is about 10 times more efficient than air per volume of gas sparged when high loadings are distributed over the day in 10 equal portions. Filtrates from aerobic stabilized sludge contain about two mg/l phosphate and about 8 mg/l total nitrogen. The rate that primary sludge can be suitably stabilized under optimal conditions of oxygenation is determined by the biological limitations of the biota. The minimal time for processing raw sludge containing 50,000 mg/l COD in the system described is about four days at 30C. (Ellis-Texas)

PULP MILL WASTE DISPOSAL AT SPECIFIC INSTALLATIONS IN SWEDEN,
Swedish Water and Air Pollution Research Lab., Stockholm.
Stig Freyschuss.
Proceedings, Industrial Waste Conference, 21st, May 3, 4, 5, 1966. Purdue University, Vol L, No 2, p 791-798, March 1966. 5 tab.

Descriptors: *Pulp and Paper industry, *Waste dilution, *Aquatic environment, *Toxicity, Wood wastes, Fibers (Plant), Slurries, Sedimentation, Hydrogen ion concentration, Chemical oxygen demand, Biochemical oxygen demand, Oxidation, Alkalinity, Acidity, *Pulp wastes, Waste water treatment.
Identifiers: *Nymolla Sulphite Mill, *Morrum Sulphate Mill, Bleach, Sweden.

Two pulp mills, located in Sweden, were investigated with regard to the amount of pollution they were producing. Both mills were located in the center of a thriving tourist trade, and both mills discharged their effluents into waters known for sport and commercial fishing. Waste output was analyzed in terms of Kg/ton of pulp as COD, BOD, fiber, and magnesium. Comparisons of these parameters were made for soft wood versus hard wood, with the hard wood generally having the higher values. Data were also collected on the same parameters at the sea disposal outlets from the two plants, and no detectable increase was observed. The overall effects of the effluent from the plant seem to be negligible, and not in any way harming either aquatic or plant life in the area. (Lowry-Texas)

AERATED STABILIZATION OF BOARD MILL WHITE PAPER,
Crown Zellerbach Corp., Camas, Wash.
Herman R. Amberg.
Proceedings, Industrial Waste Conference, 21st, May 3, 4, 5, 1966. Purdue University, Vol L, No 2, p 525-537, March 1966. 4 fig, 9 tab, 6 ref.

Descriptors: *Aeration, Pulp and paper industry, Oxidation lagoons, Biochemical oxygen demand, Biological treatment, Sludge, Industrial wastes, *Pulp wastes, *Waste water treatment, Stabilization.
Identifiers: *Aerated stabilization, Suspended solids.

A survey of the results and comparison of the present operational efficiency of the aerated stabilization lagoon with the efficiency of the original stabilization pond is presented. It was found that by adding aerators to the stabilization ponds an average of 81% of the BOD was removed, a suspended solids reduction of approximately 91%, and a biological sludge production of about 4.5 lbs/lb of BOD removed. The aeration basin, operated as a completely mixed system, was extremely effective in handling wide fluctuations in daily BOD load. Operating costs for the Baltimore treatment plant have been calculated at $0.72/ton of production or $0.0162/lb of BOD removal. (Ellis-Texas)

Proceedings, Industrial Waste Conference, 21st, May 3, 4, 5, 1966. Purdue University, Vol L, No 2, p 516-524, March 1966. 5 fig, 1 tab, 7 ref.

Descriptors: *Activated sludge, *Copper, *Toxicity, Sewage treatment, Industrial wastes, Biochemical oxygen demand, Chemical oxygen demand, Respiration, Sludge, Waste water treatment, Water pollution effects.
Identifiers: Shock loading.

Studies were carried out at The Ohio State University in which attempts were made to investigate the actual mechanism causing partial failure of the activated sludge process due to shock loadings of copper. The following hypotheses were formulated as a result of these investigations: (1) when copper bearing sewage enters the aeration tank there is a rapid redistribution of copper between the available ligands; (2) the copper equilibrium and the toxic effect will depend on copper dosage, MLSS, and influent sewage strength; (3) metabolically inactive copper complexes may be reversed, either by dilution or by the addition of uncomplexed ligands; and (4) the appearance of bacterial cells in the effluent is a result of the toxic effect of sludge. (Ellis-Texas)

TEMPERATURE AND RETENTION TIME RELATIONSHIPS IN THE ACTIVATED SLUDGE PROCESS,
Rutgers - The State Univ., New Brunswick, N.J.
Joseph V. Hunter, Emil J. Genetelli, and M. E. Gilwood.
Proceedings, Industrial Waste Conference, 21st, May 3, 4, 5, 1966. Purdue University, Vol L, No 2, p 953-963, March 1966. 5 fig, 8 tab, 8 ref.

Descriptors: *Temperature, Protozoa, Rotifers, Nitrogen, Evaporation, Biochemical oxygen demand, *Activated sludge, Waste water treatment, *Sludge treatment.
Identifiers: *Retention time, *Synthetic wastes, SVI-Sludge volume index, DNA-Desoxy ribonucleic acid, Filamentous microorganisms, Bulking sludge, Suspended solids.

As effluent standards become more strict, treatment methods previously rejected for economic reasons become more attractive. Temperature and retention time have been, investigated as possibly coming within the economical range in the near future. Increasing temperatures between 4C and 45C effected little change in BOD or SS removal efficiencies, but did result in decreased sludge carbohydrate and volatile matter contents, and increased sludge nitrogen content. Increased temperature also caused increased rotifer and protozoan population, while decreasing filamentous organisms and resulting in less MLSS accumulation. There was no uniform trend either for DNA content or SVI with temperature. Increased retention time caused decreased MLSS accumulation and higher BOD and SS removal efficiencies, while sludge volume index was not directly affected. From this study sludge, DNA content was shown to be better indicator of sludge bulking than the general appearance of the sludge under microscopic examination. (Lowry-Texas)

PURE CULTURE STUDIES OF METHANOGENIC BACTERIA,
Florida Univ., Gainesville.
P. H. Smith.
Proceedings, Industrial Waste Conference, 20th, May 4, 5, 6, 1965. Purdue University, Vol XLIX, No 4, p 583-588, July 1965. 2 fig, 2 tab, 8 ref.

Descriptors: *Cultures, *Bacteria, *Methane bacteria, Oxidation, Oxygen, Microbiology, Sludge treatment, Anaerobic conditions, Aerobic conditions, Hydrogen, Sludge, Waste water treatment.
Identifiers: *Methanogenic organisms, Substrate utilization.

The methods described were developed from the basic procedures of R. E. Hungate and have been successfully applied in the isolation and study of methanogenic bacteria from domestic sewage sludge. Pure culture studies of methanogenic organisms are difficult, owing to the extreme sensitivity of the organisms to molecular oxygen. These organisms can be isolated in pure culture using techniques which adequately control the oxygen tension. Methods for the isolation of hydrogen oxidizing methanogenic bacteria have been described. (Ellis-Texas)

PROJECT SALT VAULT: RADIOACTIVE WASTE DISPOSAL IN A SALT MINE,
Oak Ridge National Lab., Tenn.
W. J. Boegly, R. L. Bradshaw, F. M. Empson, W. C. McClain, and F. L. Parker.
Proceedings, Industrial Waste Conference, 20th, May 4, 5, 6, 1965. Purdue University, Vol XLIX, No 4, p 398-409, July 1965. 8 fig, 6 ref.

Descriptors: *Radioactive waste disposal, Temperature, Heat transfer, Economics, Radioactive wastes, Thermal radiation, Heat, Infrared radiation, Effluent, Pressure, *Waste disposal, Waste water treatment.
Identifiers: Project Salt Vault, Salt mine, The Carey Salt Company.

Chemical reprocessing of power reactor fuel produces a chemically complex and hazardous effluent that cannot be handled by conventional waste disposal methods. Studies on the disposal of high-level liquid and solid wastes were initiated at Oak Ridge National Laboratory (ORNL) to consider the heat transfer from the waste to the salt, the effects of heat and radiation on rock salt, and the economics of an actual disposal facility in a salt mine. The inactive salt mine of the Carey Salt Company of Lyons, Kansas, was chosen as a demonstration site to test and evaluate the engineering and scientific objectives. The waste-handling experience and the salt-flow data obtained in this experiment, when combined with the results of laboratory and theoretical studies on the structural stability of rock salt at elevated temperatures and pressures, should allow the establishment of a basis for the design of an actual disposal facility for optimum use of salt-mine waste. (Ellis-Texas)

5E. Ultimate Disposal of Wastes

PETROCHEMICAL WASTE DISPOSAL,
Department of Health, Edmonton (Alberta).
E. E. Kupchanko.
Man and His Environment, Vol 1, Proceedings of the First Banff Joint Conference on Pollution, The University of Calgary and the Engineering Institute of Canada, May 16-17, 1968, Banff, Alberta, Canada: New York, NY, Pergamon Press, Inc, p 53-65, 1970. 13 p, 8 fig, 42 ref.

Descriptors: *Water pollution sources, *Oil industry, *Oil wastes, *Waste treatment, *Canada, Deep well disposal, Methodology, Oily water, Water quality, Organic matter, Chemical analysis, Biochemical oxygen demand, Activated sludge, Adsorption, Oxidation, Chemicals.

Water pollution from petroleum industries and methods of waste disposal are presented. A nationwide survey in Canada indicated that the net pollution load from petroleum refineries measured as Biochemical Oxygen Demand yielded an approximate industry average of 100 lbs. per 1000 barrels of crude processed. The complexities of the disposal of Petrochemical waste calls for considerable study and evaluation of problems peculiar to each operation. Water reuse is becoming increasingly important because of the added costs of waste treatment. Disposal of mercaptans, hydrogen sulfide, oil, caustic and organic wastes is often troublesome in the petroleum and petrochemical industry and several methods are available for their removal from waste waters. Deep well disposal appears to offer a practical and economical method of disposing of extremely objectionable waste materials. Preliminary evaluation of other methods of treatment such as adsorption and solvent extraction appear, in certain circumstances, to be feasible. (See also W71-04901) (Woodard-USGS)

AGRICULTURE FACES NEW CHALLANGES IN CURRENT ENVIRONMENTAL CRISES,
Department of Agriculture, Washington, D.C. Science and Education.
Ned D. Bayley.
Water and Wastes Engineering, Vol 7, No 11, p F-14 - F-16, November 1970. 4 fig.

Descriptors: Farm wastes, Water, Water resources, Pesticides, Salinity, Sediments, Water pollution control, Fertilizers, Planning.
Identifiers: Soil spoiler.

The responsibility of agriculture in enhancing the quality of the environment is colossal. This is because agriculture, including forestry, involves more natural resources than any other segment of society. Wise planning in the use of land, water, chemicals, and waste disposal techniques must be demanded, and it must be done now. This paper outlines some of the problems and difficulties encountered in dealing with agricultural pollutants. (Christenbury-Iowa State)

OIL POLLUTION AT SEA,
John O. Ludwigson.
In: Oil Pollution: Problems and Policies, Bureau of National Affairs, Inc, Washington, DC, p 1-20, 1969. 20 p, 1 tab.

Descriptors: *Water pollution, *Oily water, *Ships, *Oil, Legal aspects, Water pollution sources, Water pollution control, Water pollution treatment, Oil industry, Oil wastes, International law, Oceans, Remedies, Legislation, Treaties, International waters, United States, Foreign countries, Foreign waters, Emulsifiers, Detergents, Chemical wastes, Accidents, Rivers and Harbors Act.
Identifiers: *Oil spillage.

After detailing the Torrey Canyon and Ocean Eagle oil spills in England and Puerto Rico, respectively, and delineating the attempts by those governments to clean up the oil and protect the ecology, this article observes that the Torrey Canyon and Ocean Eagle spills are potentially small compared to a spill by a supertanker. In the discussion of legal aspects which follows, the author generalizes that: (1) oil spills are illegal almost everywhere; and (2) a polluter is liable for all costs and damages resulting from the spill. The impact of the Oil Pollution Act of 1961, and Boundary Water Treaty with Great Britain, the Oil Pollution Act of 1924, the Refuse Act, the Federal Water Pollution Control Act, and the Outer Continenal Shelf Lands Act upon oil spills is discussed. It is noted that improved navigation devices and ship design should prevent spills. In a discussion of control and cleanup of spills, the article discusses: (1) physical collection; (2) use of absorbents; and (3) chemical dispersion. A table of chemical emulsifiers for oil dispersion concludes the article. (See also W71-04988) (Hart-Florida)
W71-04989

OIL POLLUTION AND THE LAW,
Max N. Edwards.
In: Oil Pollution: Problems and Policies, Bureau of National Affairs, Inc, Washington, DC, p 21-30, 1969. 9 p.

Descriptors: *Water pollution, *International law, *Water pollution control, *Oil, Oily water, Legal aspects, Ships, Water pollution sources, Oil industry, Oil wastes, Oceans, Remedies, Legislation, Treaties, International waters, United States, Foreign countries, Foreign waters, Pollution abatement, Accidents, Rivers and Harbors Act, International commissions.
Identifiers: *Oil spillage, Water Pollution Control Act.

Noting that the gap between oil technology and law must be closed, this article stresses the dual national and international nature of the oil pollution problem. Viewing the legal capability of dealing with oil pollution, the author discusses: (1) the 1954 International Convention for the Prevention of Pollution of the Seas by Oil, (2) the 1961 Oil Pollution Act, (3) the Federal Water Pollution Control Act, (4) the 1924 Oil Pollution Act, and (5) the Convention on the Territorial Sea and the Contiguous Zone. The author sets forth the specific changes necessary to close the gap and put oil under legal control both in the United States and the international arena: (1) change from a gross negligence or willful standard of liability for oil discharge at sea to a strict liability standard; (2) attach liability to offshore drilling spills; and (3) provide enforcement authority for the Intergovernmental Maritime Consultive Organization. Financial responsibility for oil discharge is strongly advocated. A carrier should be strictly liable for any oil pollution on the seas, and proof of financial responsibility should be required. The author also advocates an international standard for construction of oil tankers. (See also W71-04988) (Hart-Florida)
W71-04990

OIL SPILLAGE PREVENTION, CONTROL, AND RESTORATION--STATE OF THE ART AND RESEARCH NEEDS,
W. H. Swift, C. J. Touhill, W. L. Templeton, and D. P. Roseman.
In: Oil Pollution: Problems and Policies, Bureau of National Affairs, Inc, Washington, DC, p 31-61, 1969. 30 p, 1 fig.

Descriptors: *Water pollution, *Oil, *Technology, *Water pollution effects, Design, Research and development, Materials engineering, Materials testing, Emulsifiers, Detergents, Chemical wastes, Organic wastes, Water pollution sources, Water pollution control, Water pollution treatment, Oil industry, Oily water, Oil wastes, Accidents.
Identifiers: *Oil spillage.

Topics discussed in this article on oil spillage, resulting both from tankers and from offshore production operations, include: (1) technical aspects of tank-vessel design as related to prevention of oil spillage, (2) on-scene control of gross leakage, (3) destruction or recovery of open sea oil slicks, (4) disposal of recovered mixtures, (5) protection of the shore face and estuaries, (6) cleaning of shore face and estuaries, (7) slick surveillance and behavior prediction, (8) effect of oil pollution and treatment agents on marine flora and fauna, and (9) waterfowl recovery methods. The review and analysis is directed primarily toward the technical aspects of oil spillage prevention. The current state of technology is discussed, and specific recommendations are made for research and development in the areas of: (1) contingency plans, (2) oil and hazardous materials information centers, (3) prevention of oil spills, (4) control of oil spillage, (5) restoration, and (6) effects of spillage. (See also W71-04988) (Hart-Florida)
W71-04991

OIL POLLUTION: A REPORT TO THE PRESIDENT.

In: Oil Pollution: Problems and Policies, Bureau of National Affairs, Inc, Washington, DC, p 62-109, 1969. 48 p, 1 bibl.

Descriptors: *Water pollution control, *Oil, *United States, *Pollution abatement, Oily water, Water pollution, Planning, Federal government, Administrative agencies, Water pollution sources, Water pollution treatment, International law, International waters, Oil industry, Legislation, Oceans, Oil wastes, Research and development, Resources, Costs, Transfer, Storage, Pipelines.
Identifiers: *Oil spillage.

Considering it imperative that action be taken to prevent oil pollution catastrophies, the President of the United States directed a study to examine how the resources of the United States could best be mobilized against oil pollution. The resulting report to the President first relates recent oil spillage disasters, such as the Torrey Canyon, and discusses the major sources of danger from oil pollution. Topics analyzed include: (1) water borne sources, (2) waste oils, (3) industrial transfer and storage, (4) pipelines, and (5) offshore mining. The present capabilities of the nation are delineated as relate to: (1) prevention, including legal aspects, technical aspects, industrial aspects, and surveillance and notification; (2) cleanup, including contingency plans, physical cleanup operations, physical and technical capabilities, needed improvements in cleanup capability, and legal aspects of cleanup and cost recovery; (3) action programs; (4) activities underway; and (5) recommendations for early action. The report recommends more effective application of existing technology and, through expanded research and development, improvement of present technology and procedures. (See also W71-04988) (Hart-Florida)
W71-04992

NATIONAL MULTI-AGENCY OIL AND HAZARDOUS MATERIALS POLLUTION CONTINGENCY PLAN.

In: Oil Pollution Problems and Policies, Bureau of National Affairs, Inc, Washington, DC, p 110-134, 1969. 24 p.

Descriptors: *Water pollution, *Oil, *Pollution, *Planning, Oily water, Federal government, Administrative agencies, Administrative decisions, Coordination, Water pollution control, Water pollution sources, Water pollution treatment, International law, International waters, Oil industry, Oceans, United States, Oil wastes, Legislation.
Identifiers: *Oil spillage, *National Pollution Contingency Plan.

President Johnson directed preparation of the National Multi-Agency Oil and Hazardous Materials Pollution Contingency Plan. This chapter in a book on oil pollution problems and policies consists of excerpts from this plan. Effective for all United States navigable waters, the purpose of the plan is to establish a pattern of coordinated and integrated responses to pollution incidents. A national reaction team is established, and federal response operations are divided into four phases: (1) discovery and notification; (2) containment and countermeasures; (3) cleanup, restoration, and disposal; and (4) recovery of damages and enforcement. An on-scene commander, an executive agent, is predesignated to coordinate and direct pollution control activities. Numerous annexes are included in the Plan, titled as follows: (1) summary of legal capabilities available to control oil pollution; (2) national inter-agency committee; (3) joint operations center; (4) ship salvage authority of the U. S. Navy; (5) communications and reports; (6) state and local government and private interests; (7) funding, (8) procedures for reporting information and collecting samples in phase IV operations; and (9) technical information. The federal policy on the use of chemicals to treat floating oils is included. (See also W71-04988) (Hart-Florida)

INSTITUTIONAL DESIGN FOR WATER QUALITY MANAGEMENT: A CASE STUDY OF THE WISCONSIN RIVER, VOL. 2, SECTION B-HYDROLOGY,
Wisconsin Univ., Madison. Water Resources Center.
A. J. MacCormick, and Gerald J. Stadler.
Available from the NTIS as PB-197 847, $3.00 in paper copy, $0.95 in microfiche. Technical Report OWRR C-1228, 1970. 42 p, 13 fig, 6 tab. OWRR Project C-1228-WIS (1601) (2).

Descriptors: *Water management (Applied), *Rivers, *Reservoirs, *Reservoir operation, Wisconsin, Hydrologic aspects, Industrial plants, Hydrographs, Reservoir storage, Detention reservoirs, Drawdown, Early impoundment, Recreation, Water levels, Late impoundment, River forecasting, Flood control, Low-flow augmentation, Regulated flow, Hydrologic models, Streamflow, Water quality, Computer programs.
Identifiers: *Wisconsin River (Wis).

The physical features of the Wisconsin River Ba and the development of the river and its tributari are described together with its utilization hydroelectric plants, pulp and paper mills, other i dustries, agriculture, municipalities, and recre tionists. The storage reservoir system is examin in order to describe the determination of observ flows as a result of reservoir operating rules, co trol points, seasonal factors and constraints on t system. A simulation model of the flow patterns developed in order to analyze the effects of flo variation on water quality. Much of the fiscal co putation is done manually since the objective is obtain answers for representative water years ha ing high, medium, and low flow rather than to wri a generalized computer program. Using historic data records on storage and flow, a streamflo routing program represents the existing system storage reservoirs together with the river and tributaries, and permits alternative procedures f controlling the reservoir levels or for controllin the rate of flow at specific gaging stations. method for estimating flow augmentation capaci is described. (See also W71-05038 thru W7 05041). (Dorcey-Wisconsin)
W71-05037

INSTITUTIONAL DESIGN FOR WATE QUALITY MANAGEMENT: A CASE STUDY C THE WISCONSIN RIVER, VOL. 4, SECTION E COST FUNCTIONS FOR INFLUENCIN WATER QUALITY; SECTION F - RELATIO OF PARTICIPATION IN OUTDOOR RECRE TION AND PUBLIC ATTITUDES TOWAR WATER QUALITY,
Wisconsin Univ., Madison. Water Resourc Center.
Elizabeth L. David, Richard S. Howe, and John T. Quigley.
Available from NTIS as PB-197 845, $3.00 paper copy, $0.95 in microfiche. Technical Repo OWRR C-1228, 1970. 101 p, 7 fig, 34 tab, 38 re append. OWRR Project C-1228-WIS (No 160 (3).

Descriptors: *Water quality control, *Costs, *Est mating, *Wisconsin, *Recreation, *Attitudes, S cial aspects, Economics, Water pollution contro Water quality, Waste water treatment, Reaeratio Flow augmentation, Reservoirs, Property value Cost-benefit ratios, Cost analysis, Surveys, Wat pollution effects, Reservoir storage.
Identifiers: *Wisconsin River (Wis), Joint trea ment plants.

The first section of this volume (E) describes th estimation of the cost functions for influencir water quality and the second section (F) outline the relation of the participation in outdoor recre tion and public attitudes toward water quality. Co functions for influencing water quality through th following alternatives are developed: extern treatment by municipalities, external treatment f pulp and paper mills, joint facilities, and mechan cal aeration. While the cost estimates for mu nicipalities are based on regression curves, the est mate for the mills' joint facilities and aeration ar engineering cost-estimates. In the case of the mu nicipalities and the mills discrete levels of primar and secondary treatment are considered. In orde to estimate the economic efficiency of joint facil ties, estimates were made for the cost of pipeline and joint municipal and mill waste treatment. En gineering-cost estimates are made for mechanic aeration through turbine venting and in-strea aeration. Finally regression estimates were mad for the reduction in shoreland values of storag reservoirs resulting from releases for flow augmen tation. Section F reports the conclusions of a su vey which attempts to identify public definitions o water pollution and participation in water-base outdoor recreation in Wisconsin. (See also W7 05037). (Dorcey-Wisconsin)

Identifiers: *Wisconsin River (Wis).

esearch was made to determine economic cost of ydropower benefits lost due to alteration of river ows to achieve quality objectives and examination f the value of capacity and energy of the Wisconn River hydropower plants. The methodology in easuring hydropower value was based on the least stly alternative of supplying equivalent electrical nergy and capacity, within the context of the overi electricity generating system relying primarily thermal generation and composed of both ublic utilities and industries generating power for eir specific use. A computer simulated operaonal model used general hydropower production nction and regression equations to estimate the oduction functions of the system's 26 ydropower plants. Models representing electricity oduction for the component electric utility stems were based on projections of peak energy mands and total energy demands per month, and ojected generation station additions and retirement for the 1970-1990 period. The conclusion is at 1/2 of the hydropower plants were economic producers of electricity due to smaller e, age, and high operational and maintenance sts. However, hydropower is an economical urce of electricity for pulp and paper mills when mpared to the alternative of purchasing energy. is study is particularly relevant to the Wisconsin ver. ntifiers: *Wisconsin River Basin (Wis).

ese studies illuminate the implications of existing for the establishment of a regional system of ter quality management in the Wisconsin River sin. Two studies examine Wisconsin experience der existing law. One of these reviews the appli-ion of the common law and how it has func-ned; the other reviews Wisconsin experience in ulating water pollution by the Division of En-onmental Protection of the Department of Natu- Resources, and the work of conservation rdens in dealing with individual pollution cases. ree studies examine the effects of certain con-utional limitations for possible institutional nges that might be made to manage water quali-The first of these is concerned with the constitunal limitations on the construction and operation of water pollution abatement facilities. The second reviews four alternatives to divert state action to construct and operate such facilities, namely, by a state owned non-profit corporation, a special district, a private corporation, and a cooperative. The third study investigates the constitutional limitations on the use of effluent charges to regulate water pollution. (See also W71-05037). (Fox-Wisconsin)

Identifiers: *Systems concept, *Wisconsin River (Wis), Institutional design, Regional systems.

This study is concerned with the design of administrative arrangements for managing water quality on a regional system basis. It reviews existing water quality decision-making arrangements and presents two case studies on water quality management decisions in Wisconsin to indicate how groups and political parties have functioned in dealing with water quality management. The implications of the regional system approach for the design of administrative arrangements are then examined and design criteria for such arrangements developed on the basis of the current literature on organizational theory. These criteria are then applied in an evaluation of three alternative administrative models. One of these is a simple extension of existing arrangements with the existing Department of Natural Resources operating the regional system. In the second, a regional water quality management agency is envisaged as operating the regional system with the Department of Natural Resources establishing and enforcing standards. The third alternative, characterized as the inter-organizational model, would involve four agencies including a regional management agency, a quasi-judicial body to issue orders and enforce regulations, a conservation-oriented planning and standard-setting agency, and a development-oriented planning and standard setting agency. POTENTIAL ALGICIDES FOR THE CONTROL OF ALGAE,
Los Angeles County Sanitation District, Calif.
James C. Gratteau.
Water and Sewage Works, 1970 Reference Number, Vol 117, p R24-R61, November 28, 1970. 17 p, 6 tab, 27 ref.

Descriptors: *Algicides, *Water quality control, *Aquatic weed control, *Domestic water, *Surface waters, Water supply, Eutrophication, Algae, Nutrients, Water pollution, Biological treatment, Chemicals, Copper sulfate, Chlorine, Water resources, Methodology, Evaluation, Chemical analysis.
Identifiers: Rosin amine D acetate (RADA).

Problems concerning algae in water supplies and methods of controlling algae growth are discussed. In general, there are three basic methods of algae control: physical, ecological and chemical. Physical methods of control, raking, dragging, pulling, and underwater mowing have been used mainly on floating masses of algae and rooted aquatics. Ecological control of algae involves limitation of one or more of the factors necessary for growth and reproduction: light or nutrient material. Only two chemicals are widely used to control algae in water supplies, copper sulfate and chlorine. In excessive concentrations copper sulfate may poison fish and other aquatic life. Approximately 300 chemicals were screened for toxicity and their effectiveness compared with that of copper sulfate. Data for some of the most promising chemical compounds (for example, rosin amine D acetate) as determined from preliminary screening tests and toxicity studies are tabulated. A bibliography with 418 references is included. (Woodard-USGS)

A SURVEY OF CALIFORNIA COASTAL POWER PLANTS,
Federal Water Pollution Control Administration, Portland, Oreg.
R. W. Zeller, and R. L. Rulifson.
January 1970. 64 p, 16 fig, 4 ref.

Descriptors: *Thermal powerplants, Thermal pollution, Cooling water, *Environmental effects, Intakes, Fishkill, Heat treatment, Temperature, Water pollution effects, *California, Coasts, *Powerplants, Sites, Operations.
Identifiers: *Coastal powerplants, Siting, Shoreline outfalls, Outfalls, Policy.

The Northwest Regional Office, FWPCA, initiated a tour in May, 1969 to obtain information on the sites, operation, and environmental effects of representative coastal powerplants in California. Out of the ten powerplants visited, nine are gas-oil fueled and the tenth is nuclear fueled. The purpose of these surveys is to facilitate development of waste heat discharge requirements and to document environmental changes due to heated discharges and the possible need for changes in discharge requirements. Pacific Gas and Electric Company and S. C. Edison Company have developed standard procedures for the design of intake structures to minimize the losses of small fish. Shoreline intakes reduce fish losses by avoiding the high conduit velocities associated with offshore intakes. The powerplants visited subject their cooling water intake systems to periodic heat treatment to control mussels, clams and other incrustations. Based on temperatures at least 4F above ambient, the heated discharge from the outfalls may effect volumes of water up to 100 acres in area and up to 15 feet thick. A lack of well-defined policies and coordination in regard to site evaluation will preclude considerations of the marine environment as a major factor in the location, design, and operation of powerplants. SURFACE HEAT EXCHANGE AT POWER PLANT COOLING LAKES,
Johns Hopkins Univ., Baltimore, Md. Dept. of Geography., Johns Hopkins Univ., Baltimore, Md. Dept. of Environmental Engineering.
D. K. Brady, W. L. Graves, and J. C. Geyer.
Cooling Water Discharge Project Report No 5, Edison Electric Institute, New York, November 1969. 154 p, 61 fig, 7 tab.

Descriptors: *Thermal pollution, *Cooling water, *Power plants, Forecasting, Winds, Dewpoint, Computers, Diffusion, Solar radiation, Hydraulics, Water pollution control, Cooling, Temperature.
Identifiers: *Heat exchange, Exchange coefficient, Equilibrium, Cooling ponds.

This report describes analytical methods for computing rates of surface heat exchange at power plant cooling lakes. The preparation of data for computer analysis is summarized, and computer produced graphs are extensively used to demonstrate characteristics of the data and relationships for evaluating exchange coefficients and equilibrium temperatures. The main results of the study were: (1) the capacity for cooling lakes to dissipate heat under low wind speed conditions is shown to be appreciable. (2) The equilibrium temperature is shown to be closely approximated by the dewpoint temperature .. (solar radiation divided by exchange coefficient.) The application of these findings to the design of power plant cooling lakes and to the evaluation of hydraulic diffusion rates is discussed. (Upadhyaya-Vanderbilt)

BENEFICIAL USE OF WASTE HEAT-AN EVALUATION,
Federal Water Pollution Control Administration, Corvallis, Oreg. Pacific Northwest Water Lab.
R. R. Garton, and A. G. Christianson.
Paper for presentation at Conference on Beneficial Uses of Thermal Discharges, New York State Department of Environmental Conservation, September 18, 1970. 12 p. FWQA Program 16130 FHJ 9/70.

Descriptors: *Thermal pollution, *Beneficial use, Temperature, Organic wastes, Economics, Cooling water, Irrigation, Powerplants, Water pollution control.
Identifiers: *Waste heat, Aquaculture, Space heating.

In the overall environmental ecological framework, a beneficial use of waste heat must help reduce the thermal pollution problem directly or it must provide a profit to help offset the cost of cooling devices. Only aquaculture, agriculture and integrated agro-industrial complexes fit this categorization. There is a successful small scale commercial plant in Texas where catfish are raised in cages in a powerplant discharge canal which maintains suitable temperature for optimum growth. Marine fishes have been raised in warmed sea water in Scotland and shrimp in warm powerplant effluent in Florida. The problem of organic pollution has been largely ignored in past aquaculture studies. In a recently completed study in the Pacific Northwest, it was found that 114 hatcheries were releasing approximately 23 tons of BOD per day. In the future a more conscious optimization of distribution, irrigation and heating systems will be required. Pollutional side effects of warm water irrigation could include, changes in temperature or chemical characteristics of groundwater, spreading of pesticides and stream warming through short circuiting of return water. Another possible use of waste heat is spaceheating. The two discouraging factors for this use are the low temperature of typical powerplant waste water and relatively low load factor of space heating systems. (Upadhyaya-Vanderbilt)

WATER QUALITY, THE STATE OF THE ART,
Wayne State Univ., Detroit, Mich.
Henry Dirasian.
Urban Affairs, Vol 6, No 2, p 199-212, Dec 1970.

Descriptors: *Water quality, Water supply, Water pollution, Waste water treatment, Biochemical oxygen demand, Tertiary treatment, Cost allocation.
Identifiers: *Recycling, Disposal costs.

The problems of water pollution control and solid waste disposal are considered. An analysis of the technology of primary and secondary waste water treatment is given with the main impact of secondary treatment being on the further reduction of biochemical oxygen demand (BOD) of the waste water. Techniques for tertiary treatment are described with stress on filtration techniques and electrical processes. The author compares solid waste disposal and waste water treatment and suggests solid waste recycling can be profitable while waste water treatment costs are a municipal burden. Water quality standards established by the State of Michigan Water Resources Commission are discussed by the author to illustrate the relation between uses of streams and the amount of contaminants allowable for water supply, recreational, agricultural, and commercial purposes. The author finds waste water treatment problems are no longer of a technical nature but due mainly to insufficient cost allocation by municipalities and industrial plants. (Siegenthaler-Rutgers)

trends, Economic growth.

Iowa industry generates an amount of orga
wastes which have a pollution effect of more th
twice the present population. In addition, a la
amount of inorganic waste is also present. Ho
ever, the present situation is such that the nature
control and regulation can be largely prevent
rather than exclusively corrective. This is due
the relatively even distribution of industrial activ
throughout the state. The principal problems
those associated with formulation and implemen
tion of policy concerning the use of the stat
water resources. Conflicting uses must be eva
ated and the effect of different waste constitue
on other uses of water resources analyzed. Uniq
problems are created by the differences in
economic base between industrial and public are
and these must be recognized in cost-bene
analyses and method comparison. The tendency
these differences to favor low-investment ope
tions with high operating costs must be prevente

A review is conducted on the federal governmen
role in controlling water pollution, and the chang
in public attitude toward water resources broug
about by changes in the economic environment ar
the need for efficient water management. Th
Water Quality Act of 1965 and the Clean Wat
Restoration Act of 1966 have marked change
public awareness of the problem brought about b
increased population paralleling in industrial ar

hnological expansion. The economic progress of cent years has changed water from a free good to e whose cost is steadily rising. The relevant estion is whether this cost should be borne by the ter user or the waste discharger. The author cusses this basic problem and argues in favor of latter approach. (Murphy-Rutgers)

OIL SOAKED STRAW HARVESTING TECHNIQUES,
Marsan Corp., Elgin, Ill.
John D. Harper.
Prevention and Control of Oil Spills, Joint Conference, Proceedings, New York, New York, December 15-17, 1969, Co-sponsored by American Petroleum Institute and U.S. Federal Water Pollution Control Administration, Washington, D.C., American Petroleum Institute Publication No 4040, p 249-251.

Descriptors: Oil wastes, *Absorption, *Mechanical control, *Cleaning, Water pollution control.
Identifiers: *Harvesting techniques, Straw, *Oil pollution, Coastal pollution.

Mechanical recovery of oil pollutants is reviewed with emphasis on straw as an absorbent material and methods for the harvesting of the oil soaked straw. State-of-the-art harvesting techniques are complicated by the many varying circumstances surrounding oil pollution incidents. The development of new harvesting equipment to be used by various types of vessels will permit wider and more effective usage of straw in oil pollution control. (See also W70-10035) (Ensign-PAI)

EVALUATION OF DISPERSANTS,
British Petroleum Co. Ltd., London (England). Research and Technical Development Dept.
L. R. Beynon.
Prevention and Control of Oil Spills, Joint Conference, Proceedings, New York, New York, December 15-17, 1969, Co-sponsored by American Petroleum Institute and U.S. Federal Water Pollution Control Administration, Washington, D.C., American Petroleum Institute Publication No. 4040, p 209-215. 4 fig, 3 tab.

Descriptors: *Oil wastes, *Water pollution control, Cleaning, Chemicals, Evaluation, Dispersion, *Oil-water interfaces, Oily water.
Identifiers: *Dispersants, Oil pollution.

The way in which dispersants work is that they change the interfacial properties of oil and water, breaking up an oil layer into very small droplets by agitation which is dispersed into the sea. Application and techniques for supplying agitation to the treated oil differ depending on whether the oil is floating or has come ashore. Often dispersants which are very effective for floating oil may be of no use in dealing with beach cleaning, however the reverse is not necessarily true. Separate methods of evaluating the effectiveness of dispersants at sea and on shore are indicated. (See also W70-10035) (Ensign-PAI)
W71-05328

EVALUATION OF THE EFFECTIVENESS OF OIL-DISPERSING CHEMICALS,
Federal Water Pollution Control Administration, Edison, N. J. Water Quality Lab.
T. A. Murphy, and L. T. McCarthy.
Prevention and Control of Oil Spills, Joint Conference, Proceedings, New York, New York, December 15-17, 1969, Co-sponsored by American Petroleum Institute and U.S. Federal Water Pollution Control Administration, Washington, D.C., American Petroleum Institute Publication No 4040, p 199-207. 7 fig, 4 tab, 19 ref.

Descriptors: *Oil wastes, *Water pollution control, *Cleaning, Chemicals, Laboratory tests, Evaluation, Dispersion, *Emulsifiers, Oily water.
Identifiers: Effectiveness evaluations, *Dispersants, Oil pollution.

An evaluation method for the effectiveness of oil-dispersing chemicals has been developed. The apparatus was originally designed for Navy specification for solvent-emulsifiers and has been adapted to correspond to typical environmental conditions. Type of oil, composition of salt water solution, degree of agitation of chemical-oil mixture, and the amount of contact between chemical and oil before agitation were the conditions demonstrating most effect on dispersment. Results from this procedure (the Simulated Environmental Tank Test) are in accord with results from field tests. (See also W70-10035) (Ensign-PAI)

LIMITED OIL SPILLS IN HARBOR AREAS,
Naval Facilities Engineering Command, Norfolk, Va. Atlantic Div.
J. Stephen Dorrler.
Prevention and Control of Oil Spills, Joint Conference, Proceedings, New York, New York, December 15-17, 1969, Co-sponsored by American Petroleum Institute and U.S. Federal Water Pollution Control Administration, Washington, D.C., American Petroleum Institute Publication No 4040, p 151-156. 5 fig, 11 ref.

Descriptors: *Oil wastes, *Cleaning, *Harbors, *Cost analysis, Costs, Water pollution control.
Identifiers: Limited spills, Oil removal costs, Oil pollution.

Limited oil spills are numerous and occur frequently, they require proper treatment, and are expensive to treat. The physical conditions affecting an oil spill, the type of equipment used, and the extent of the removal operations are contributing factors to the high cost of cleaning up limited oil spills. At the time of the writing of this paper the typical limited oil spill costs the Navy over $1,000 to clean up. This cost will increase as control agencies of Harbor water quality require more complete removal and cleanup. (See also W70-10035) (Ensign-PAI)

Descriptors: *Systems analysis, *Optimization, *Water resources development, Water management (Applied), California, Nevada, Deserts, Arid lands, Irrigation design, Irrigation efficiency, Mathematical models, Simulation analysis, Synthetic hydrology.
Identifiers: Truckee River System (Calif-Nev).

Criteria were developed for management decisions affecting the optimization of complex river system. A NUMBER OF NEWLY—DEVELOPED TOOLS IN THE FIELD OF WATER RESOURCES PLANNING WERE CRITICALLY EVALUATED FOR USE UNDER REALISTIC SITUATIONS. The hydrology of the Truckee River System, Nevada and California, was examined defining the inputs, the hydrologic interactions, and the outputs from the system. Techniques for streamflow data synthesis were examined to determine which of the several methods available was best suited to the multiple-site study. The hydrologic model together with the synthetic flows generated provided a simulation model of the system which was combined with an optimization technique for optimal policy determination. This method of combining the hydrology of the system, streamflow synthesis, and an optimization technique is valid and valuable. (Knapp-USGS)

SYSTEMS ANALYSIS, A SUBSTITUTE FOR PLANNING,
California Univ., Los Angeles.
John A. Dracup.
In: Evaluation Processes in Water Resou Planning, Urbana, Illinois, American W Resources Association, p 26-40, July 1970.

Descriptors: *Systems analysis, Water reso planning, Optimization, Decision-making, C benefit analysis, Uncertainty, Waste water col tion, Economic efficiency.
Identifiers: *Multiple objective planning, So welfare function, Transformation curve, Objec function, Decision theory.

The role of systems analysis in water reso planning is considered. The paper discusses the plication of systems techniques to the measuren of benefits from multiple objective water reso projects. The example of the Great Lakes is g to illustrate the use of systems analysis as a t tilevel-multilayer approach to a complex syst This systems model represents the ecolog physical, biological, processes as well as economic, social, and political aspects of the G Lakes problem. The problem of uncertainty ca incorporated into the analysis through app decision theory. Since this example involves t tipe objective functions, there is no unique solu but a set of efficient solutions exists. Systems an sis provides the decision-maker or planner recommended policies and possible alternat when the dynamics of the system changes. The of systems techniques has been limited with res to waste water collection and treatment sys design. The author concludes that while researc water resource system field is advanced, its im on water resource planning remains limi (Siegenthaler-Rutgers)

lable from NTIS as PB-197 729, $3.00 in r copy, $0.95 in microfiche. Completion Re- October 1970. 106 p, 18 fig, 13 tab, 45 ref. RR Project C-1447 (No 198C) (1).

riptors: *Wild rivers, *Cost-benefit analysis, ngible benefits, *River basin development, odology, Social values, Aesthetics, Monetary fits, Project planning, Optimum development , Recreation, Costs, Washington, *Evaluation. tifiers: *Scale of development, *Nonmonetary fits, *Skagit River basin, Sauk-Suiattle River , Subjective decisions.

methods were developed to include intangi- nonmonetary benefit valuations within tradi- l cost-benefit analyses. Each method was onstrated for the Upper Skagit River Basin (a ntly developed basin) and for the Sauk-Suiat- iver Basin (a currently wild river), two ad- t basins in the State of Washington. The fits Foregone--Subjective Decision Method res (1) estimates of monetary benefits for osed levels of basin development (including ver left wild as one alternative), (2) values for two coefficients in a parabolic equation expressing change of intangible, nonmonetary benefits with increased development, and (3) comparison of total benefits to costs (evaluated independently) to indicate the optimum development level. The Nonmonetary Expression of Benefits Method requires monetary benefits and costs just as in the first method, but nonmonetary benefits are calculated as percentages (up to 1000%) of the identifiable monetary benefits. These percentages are derived from multipliers supplied for each potential water use group or development purpose. The demonstrations for each method indicated that the Sauk-Suiattle River should be left wild, while the Skagit River should be even more fully developed. The research showed that meaningful intangible benefit evaluation is not particularly difficult.

Identifiers: Land use policy.

For local govermental units to participate effectively in the provision of public recreation facilities at multipurpose reservoir projects, private recreational investment must supplement existing local fiscal resources. Recreational residential development offers one important means of achieving this end, but reservoir shoreline development tends to be unevenly distributed in the Southeast. Before residential investment prospects can be incorporated into water resource project planning, factors influencing variation in reservoir shoreline development should be identified and evaluated wherever possible. Analysis of data from 74 multipurpose reservoir projects in the Southeast indicates that the residential use of water projects is primarily a function of various aspects related to the size of a project, the number and affluence of people living nearby (within 25 miles), and the visual attractiveness of the project. Considering the extent of taxable private shoreline investment as a criterion, local provision of public recreational facilities seems to be feasible for larger reservoirs located within relatively populous and affluent jurisdictions. In the case of smaller reservoirs in low income or rural areas, local government should probably not be expected to provide such facilities, nor, it seems, should local officials expect private recreational investment at multipurpose reservoirs to provide much in the way of fiscal dividends. ECONOMIC ANALYSIS OF WATER USE IN ILLINOIS AGRICULTURE,
Illinois Univ., Urbana. Dept. of Agricultural Engineering; and Illinois Univ., Urbana. Water Resources Center.
Earl R. Swanson.
Available from NTIS as PB-197 732, $3.00 in paper copy, $0.95 in microfiche. Illinois Water Resources Center Research Report No 38, January 1971. 59 p, 19 tab, 8 ref. OWRR Project B-014-Ill (6).

Descriptors: *Irrigation, Linear programming, *Dynamic programming, Crop response, Farm management, *Regression analysis, Soil moisture, *Cost analysis, *Corn (Field), *Evaluation, Illinois, Irrigation efficiency.
Identifiers: Economic analysis.

Approximately 28,000 acres of field and specialty crops were irrigated in Illinois in 1966. Supplemental irrigation of corn accounted for over one half of this acreage. Important elements in the decision to invest in irrigation equipment for corn include the expected effect of irrigation on year-to-year fluctuations in income and on average income. Regression models were used to estimate the influence of moisture variable on corn yield. A moderate gain in expected income from corn was obtained by employing the irrigation policy dictated by dynamic programming rather than the policy from a moisture-deficit model. In addition to the economic analysis of the irrigation of corn viewed as a single crop, it was necessary to examine its role in the context of the total farm business. The competitive position of corn in the rotation was evaluated. Labor distribution was an important factor in determining an optimal cropping pattern. General rules were developed for adjusting leases on rented farms to provide economic incentives for both landlord and tenant to adopt supplemental irrigation. The results of all of the analyses would have been substantially improved with crop-response data from experiments in which the range of variation of water and complentary cultural practices included economically optimal levels of these inputs. WATER SUPPLY MANAGEMENT PLAN FOR MUSKEGON COUNTY,
Muskegon County Metropolitan Planning Commission, Mich.; and Bauer Engineering, Inc., Chicago, Ill.

Available fron NTIS as PB-195 769, $3.00 in paper copy, $0.95 in microfiche. Muskegon County Metropolitan Planning Commission Report, Dec 1969. 101 p. HUD Project No P-295.
Identifiers: *Regional planning, Michigan, *Water supply, Regional planning, Management planning, Groundwater, Surface water runoff, Industries, Re-

sidential buildings, Recreation, Water conservation, Statistical data, Cost estimates, Maps, *Muskegon County, Michigan.

The intent of this report is to provide a framework for a coordinated, guided, and planned management of water supply systems in Muskegon County. As a basis for this framework, an inventory of present water quality, quantity, location, and usage is provided. All sources of water, groundwater, inland surface water, and Lake Michigan water, are considered. Residential, commercial, and industrial water usage are discussed. Public attitudes toward water supply have been surveyed and are reported. A management strategy (a process-oriented version of a plan) is proposed. Here major issues in water supply management; namely: (1) the formulation of a coordinating body; (2) the expansion of public supply service areas; (3) water for recreation; and (4) water conservation are discussed in reference to the development of a country-wide approach to water supply.

William A. Strang.
Available from NTIS as PB-195 744, $3.00 in paper copy, $0.95 in microfiche. Sea Grant Technical Report No 4, WIS-SG-71-204, Oct 1970. 68 p, 2 fig, 14 tab, 52 ref. NSF Grant GH-102.
Identifiers: *Economic development, *Wisconsin, *Recreational facilities, *Lakes, Regional planning, Industrial management, Water quality, Mathematical models, Cash flow, Water resources, Statistical data, Sea Grant program, Recreation oriented economics, Green Bay (Wisconsin), Door County (Wisconsin), Tourism, Input output models.

The scope was broadened of a marine research program conducted in Green Bay, a major bay of Lake Michigan. The findings are presented of the first stage of a 3-stage project to relate water quality to the economic health of an area oriented toward outdoor recreation. The 3 project stages are: (1) Identify the economic interactions in the area and trace the total impact of tourism on the economy; (2) measure the direct and indirect economic impacts of specific groups of tourists on the local economy; and (3) relate the several dimensions of the quality of local water resources to the number of tourists drawn to the area in these specific groups. It will then be possible to relate water quality to an important segment of the local economy.

WATER PROJECTS -- A CHANGING PERSE TIVE,
Sierra Club, San Francisco, Calif.
Michael McCloskey.
Sierra Club Bulletin, Vol 55, No 7, p 8-11, 1970.

Descriptors: *Project feasibility, *Economic ju cation, *Evaluation, *Water resources deve ment, *Federal project policy, Water manager (Applied), Political aspects, Water policy, Fed government, Water Quality Act, History, S aspects, Social needs, Water conservation, Leg tion, California, Arizona, Arkansas, Projects, River Act, Benefits, Hydroelectric power.
Identifiers: *Central Arizona Project.

Most of the politically and economically desir water projects have been built largely in western U.S. In earlier periods, public policy benefit of the doubt to the case for constructio water projects. However, conditions which once have justified this approach have char radically. Nevertheless, that past great perio water project development has generated pow federal agencies having vested interests in cont ing these activities, even though diminis returns may be accruing in terms of total pu values stemming from further projects. Cur goals of the Federal Power Commission, Corp Engineers and Bureau of Reclamation are revie and discussed. It is argued that tradition and terests of special clienteles are too often dicta irrelevant, or uneconomic projects and the us obsolete methods. An example is the Cen Arizona Project, which will create an artifi agricultural demand which would not exist in absence of a heavy water cost subsidy. There a basic aspects of water project evaluation: engin ing, economics and intangibles. Enginee aspects could be handled by the construction ag cy but the other 2 aspects should be handled separate evaluating agencies. Congressi evaluation and legislation of agency proposal also in great need of modernization. (Case Arizona)

CIAL PROBLEMS OF METROPOLITAN TER RESOURCES ANALYSIS,
cago Univ., Ill.
n R. Sheaffer.
Evaluation Processes in Water Resources ning, Urbana, Illinois, American Water ources Association, p 75-90, July 1970.

criptors: *Water resources management, *Mul-purpose projects, Water quality, Cost-benefit ysis, Decision-making, Waste water treatment, ulation analysis, Political constraints.
tifiers: *Metropolitan planning, Complex agement strategy, Iterative process.

ropolitan water resource management is conred to be a subsystem of the total urban system. author identifies a number of concepts of ropolitan water resource management includmultiple purpose planning, public and private sion-making on water resources projects and political constraints on policy making. The example of Waterloo, Iowa is used to demonstrate the weakness of single purpose strategies for water resource planning. The complex management strategy is introduced as an alternative approach with the use of water as an organizing concept. The organizing concept discourages single-purpose strategies and provides a means for channeling the information required for an optimal solution. The Muskegon County waste water management plan is used to present methodology for the implementation of new technology in a metropolitan area. This plan recognized the need for broad unified goals and facilities plus community involvement and education. A model of waste water irrigation is also presented to illustrate the use of computer simulation in the complex management strategy. Stress is given to the need for research concerning the adaptation of models and planning processes to the metropolitan region. (Siegenthaler-Rutger)

ANALYSIS OF PROJECTS FOR ECONOMIC GROWTH,
Project Development, Inc., Washington, D.C.
Morris J. Solomon.
New York, Praeger, 1970. 498 p.

Descriptors: *Decision-making, Benefit-cost analysis, Economic evaluation, Discount rate.
Identifiers: *Project analysis, Economic growth, Payback period, Opportunity cost, Sensitivity analysis, Present value, Time horizon.

A framework is presented for project analysis that can be used to evaluate alternative projects in addition to the primary project. The framework specifies the data required, the format to be used, and the criteria to apply to the evaluation of alternatives. The process of decision-making is described in terms of a planning-action feedback cycle. The fundamentals of time phasing and discounting are described with their use as tools for project evaluation outlined. Economic yardsticks such as national gross rate of return and surplus rate of return are proposed to serve as indicators of the attractiveness of a project from an economic growth point of view as well as the impact on particular groups in the economy. The problems of interdependence among projects and uncertainty are discussed with procedures for dealing with each problem illustrated. This book is relevant for water administrators concerned with the formulation, evaluation, and implementation of water resource projects. (Siegenthaler-Rutgers)

REVELATION OF PREFERENCE FOR A PUBLIC GOOD WITH IMPERFECT EXCLUSION,
Northwestern Univ., Evanston, Ill.
Morton I. Kamien, and Nancy L. Schwartz.
Public Choice, Vol IX, p 19-30, Fall, 1970.

Descriptors: *Economic evaluation, *Government, *Resource allocation, Economic efficiency, Model study, Prices, Optimization, Social aspects, Probability, Maximization, Demand.
Identifiers: *Public goods, *Utility, *Preference function, *Exclusion, *User charges.

The model presented is designed to explain the behavior of an individual in revealing his preferences regarding goods which do not permit perfect exclusion. This is particularly relevant to the case of water resources recreation in which the authors' explanation of user charges is most applicable. It is shown that a bid of zero will be made if the public good does not increase his total utility at a zero price or if the probability of being able to consume the good without payment is sufficiently large. The paper derives the difference between the maximum the individual would be willing to pay rather than do without and the optimal amount he would bid in the presence of imperfect exclusion. The individual almost always understates some of his preference for the good but it is shown that the individual's offer increases, and hence moves in the direction of his true preference, as the degree of exclusion increases. This article is relevant for establishing cost justifications with respect to many of the environmental amentities associated with water investment projects. (Murphy-Rutgers)

CHOICE OF TECHNIQUE IN THE PUBLIC SECTOR: A SIMPLIFICATION,
Harvard Univ., Cambridge, Mass.
Martin S. Feldstein.
The Economic Journal, Vol LXXX, No 320, p 985-989, December 1970.

Descriptors: *Benefits, *Costs, *Discount rate, *Economic evaluation, *Government, Time, Capital, Investment, Social aspects, Economic efficiency, Optimization, Taxes, Mathematical study.
Identifiers: *Social time preference, *Social rate of return, *Opportunity costs.

The aggregation of the benefits and costs of public water resource investments raises the problem of incorporating both the normative social time preference discount rate and the social rate of return on private investment. This paper attempts to show that in an important special class of public-expenditure decisions the problem of evaluating the social opportunity cost of funds transferred from the private sector can be ignored and only the social time preference rate is important. Thus, the paper is relevant for the evaluation of water resource investments. The author also argues against the suggestion that all public expenditure proposals be evaluated only at the social time preference rate with no regard for the social opportunity costs of the funds transferred from the private sector. Boulder, University of Colorado Press, 1967. 249 p.

Descriptors: *Environment, Cost-benefit analysis, Program budgeting, Decision making, Economic evaluation.
Identifiers: *Public good, Social benefit, Social cost.

The papers were presented at the Conference on the Present and Potential Contribution of the Social Sciences to Research and Policy Formulation in the Quality of the Physical Environment in 1967. They were cross-disciplinary and are illustrations of contributions of several disciplines to research in the quality of the physical environment. The subjects considered included ecology, program budgeting, public goods valuation and a multidisciplinary attack on water pollution. The use of cost-benefit analysis in public decision-making was discussed along with the empirical problems of calculations. The treatment of such topics as public goods, cost benefit analysis and water pollution problems makes this bookof general relevance to water studies. (See also W71-05246) (Siegenthaler-Rutgers)

ECONOMICS AND THE QUALITY OF THE ENVIRONMENT, SOME EMPIRICAL EXPERIENCES,
Resources for the Future, Washington, D.C.
Allen V. Kneese.
In: Social Sciences and the Environment, Boulder, University of Colorado Press, 1967, p 165-182.

Descriptors: *Cost-benefit analysis, Probability, Economic evaluation, Resource allocation, Mathematical model, Flood control.
Identifiers: *Willingness to pay, Public good, Externalities, Social benefit.

Experiences and problems of estimating the benefits of environmental improvement are discussed. With respect to benefit evaluation, the economists' conceptual framework uses prices as indicators of social value or benefits. Where market failure occurs, certain market prices together with assumptions about human preferences and behavior care are used in the valuation process. An example of this imputation procedure is the determination of flood control benefits where the measurement of the benefit can be taken as the avoidance of the loss. The author discusses the willingness to pay for improved water quality from the point of view of municipal and industrial users and recreational use. Research indicates that the benefits of improved water quality to municipal and industrial users do not justify the incremental costs. With respect to recreational use, the total value attached to recreational resources is a function of the number of people who have access and the availability of alternatives. The author stresses the need for further research on the benefits of water improvement for recreational demand. (See also W71-05245) (Siegenthaler-Rutgers)

PLANNING-PROGRAMMING-BUDGETING: A SYSTEMS APPROACH TO MANAGEMENT,
Washington Univ., Seattle.
Fremont J. Lyden, and Ernest J. Miller.
Chicago, Markham Publishing Company, 1967. 443 p.

Descriptors: *Systems analysis, Economic evaluation, Cost-benefit analysis, Decision-making, Economic efficiency, Risk, Program budgeting.
Identifiers: *Planning-Programming, Budgeting, Cost utility analysis.

This book presents a collection of readings that provide an understanding of Planning-Programming-Budgeting (PPB) and its implications in managerial as well as policy contexts. PPB places emphasis upon program results and analytical techniques and thus affects public management. The essays consider what the PPB approach to management is, its stages of development, the relationship of PPB to other kinds of budgeting approaches, and its limitations and deficiencies. This book is relevant to water studies concerned with the application of new budgeting approaches to program evaluation and project selection. (See also W71-05248) (Siegenthaler-Rutgers)

TOWARD A THEORY OF BUDGETING,
International Atomic Energy Commission, New York.
Verne B. Lewis.
In: Planning-Programming-Budgeting: A Systems Approach to Management, Chicago, Markham Publishing, 1967, p 117-139.

Descriptors: *Budget estimation, Marginal utility, Incremental analysis, Economic evaluation, Cost-benefit analysis, Forecasting.
Identifiers: *Public expenditure budgeting, Alternative budgeting, Open-end budgeting, Unit costing, Fixed-ceiling method, Opportunity cost.

Analyzes were made of propositions derived from economic theory which are applicable to public budgeting and can serve as the basis for an economic theory of budgeting. The economic aim of budgeting is to achieve the efficient use of resources. To meet this aim, the benefits derived from any expenditure must be worth their cost in terms of sacrificed or displaced alternatives. Incremental analysis at the margin is applied to concentrate attention on resources which yield the higher return. These values can be compared by determining their relative effectiveness in achieving a common purpose. The author suggests the alternative budget procedures as a method of budget analysis. Its purpose is to pose budget questions in terms of relative value at every level of decision making. Under alternative budgeting, officials would present both a basic budget estimate and plans for alternative amounts near the margin. A comparison of alternative budgeting is made with existing budgeting techniques. This article is relevant for water research concerned with the budgeting control of water resource programs. DEFINITION AND MEASUREMENT OF UGHT LOSSES: THE NORTHEAST UGHT OF 1962-1966,
urces for the Future, Washington, D.C.
ord S. Russell.
In: Proceedings of the Fourth American Water Resources Conference, New York, NY, November 18-22, 1968, p 623-635.

Descriptors: *Decision making, *Drought, Cost-benefit analysis, Cooling tower, Recirculated water, Economic evaluation, Discount rate.
Identifiers: *Social cost, Opportunity cost, Public investment.

A study was made of drought losses based on field work in three Massachusetts cities. Interviews were conducted with managers of industrial firms and commercial establishments in order to make an initial estimate of drought losses. The raw annual drought losses tended to be dominated by the industrial and municipal government sectors. The bulk of losses were business investment in wells, cooling towers, lost municipal revenues, and the costs of emergency water supplies. Corrections were made for the investment aspect of losses with an aggregate profit resulting from drought induced investment. Further corrections were performed for the transferral or deferral of production and unemployment. It was found per capita losses increase with the size of the water shortage with the rate of increase being smaller for the corrected estimates. This example of loss estimation is useful for the planning of water supplies in the future. (Siegenthaler-Rutgers)

THE EVALUATION OF RISKY INTERRELATED INVESTMENTS,
Stanford Univ., Calif.
Frederick S. Hillier.
Amsterdam, North-Holland Publishing Company, 1969. 113 p.

Descriptors: *Economic evaluation, *Risk, Linear programming, Probability distribution, Decision-making, Budget constraint.
Identifiers: *Interrelated investment, *Chance-constrained programming, Present value, Expected utility, Cash flow, Algorithm, Non-parametric statistics.

The problem of evaluating a proposed set of risky interrelated investments is studied, using present value and expected utility of present value as criteria. The author developed properties that characterize and optimal combination of investments and then formulated a model for describing interrelated investments. This model can be used for determining the mean, variance and functional form of the probability distribution of present value. An approximate linear programming and an exact branch-and-bound algorithm were developed for selecting the investment to be made. The problem was studied also from a dynamic point of view using chance-constrained programming models for maximizing present value subject to probabilistic constraints on the allowable risk. The advantage of the expected utility approach lies in its precise evaluation of investments while the chance-constrained programming approach is dynamic and easier to implement. This book is relevant to water resource studies concerned with the application of evaluation techniques to problems of capital budgeting and investment planning. (Siegenthaler-Rutgers)

EDWARD BALF CO V HARTFORD ELECTRIC CO (REMEDIES FOR OBSTRUCTION OF NAVIGABLE RIVER).

138 A 122-127 (Conn 1927).

Descriptors: *Connecticut, *Navigable waters, *Navigation, *Remedies, Damages, Conduits, Construction, Riparian land, Riparian rights, Channels, Dredging, Bridges, Federal government, Banks, Water levels, Navigable rivers, Administrative agencies, Legal aspects, Judicial decisions, Adjudication procedure.

Plaintiff roadbuilding company sought an injunction to restrain defendant electric company from maintaining a conduit over a river, thereby obstructing navigation and preventing plaintiff from transporting materials by boat to its land. Defendant contended that the river was not navigable and that therefore such an action could not be maintained. The trial court found: (1) that the river was navigable, (2) that defendant's conduit obstructed navigation, but (3) that the conduit constituted a public nuisance and plaintiff did not show an injury distinct from others. Both parties appealed and the Connecticut Supreme Court of Errors affirmed. Evidence showed that the stream was navigable. The federal government exercised jurisdiction over it as a navigable stream. A river is navigable when it is used or is susceptible of use in its natural and ordinary condition as a highway for commerce. The fact that this river had not been used recently by boats and would need some dredging did not render it non-navigable. Plaintiff's evidence did not show substantial, serious, or actual damage. The fact that plaintiff was deprived of access to its land by water was not conclusive of a special injury to its business. (Duss-Florida)

FEDERAL PROTECTION OF ENDANGERED WILDLIFE SPECIES,
William S. Boyd.
Stanford Law Review, Vol 22, No 6, p 1289-1309, June 1970. 21 p, 138 ref.

Descriptors: *Wildlife, *Wildlife conservation, *Wildlife management, *Federal government, State governments, Legislation, Legal aspects, Judicial decisions, Administration, Environment, Ecology, Environmental effects, Regulation, Standards, Hunting, Fishing, Animal behavior, Migratory birds, Waterfowl, Fish, Conservation, Nesting, Breeding, Federal jurisdiction, State jurisdiction, United States.

Advocating increased federal protection of endangered wildlife species, this note considers the constitutional aspects of the issue and suggests possible directions for federal regulation. Traditionally states have exercised primary responsibility for wildlife protection; however, state efforts have been largely ineffective. Heretofore, the federal government's contribution in the area has been minimal. Opponents of federal legislation have argued that: (1) the issue was decided against the government in the Supreme Court decision of Missouri v. Holland; (2) there is no enumerated provision in the Constitution permitting the government to enact such legislation; and (3) the states are sole owners of wildlife within their borders, and such ownership

precludes federal interference. This note argues that: (1) Missouri v. Holland did not preclude federal legislation for wildlife protection, (2) the territorial power or commerce clause in the Constitution could serve as a basis for legislation, and (3) the doctrine of state ownership of wildlife has been ineffective where it has conflicted with federal interests. Exclusive federal control over wildlife is not needed, but legislation should empower appropriate federal departments to promulgate necessary regulations and encourage states to adopt effective programs for wildlife protection. At any rate, exclusive jurisdiction should not be left to the states. (Duss-Florida)

OIL POLLUTION DAMAGE TO NAVIGABLE WATERS AND MARINE LIFE GIVES RISE TO MARITIME LIEN WHICH WILL SUPPORT ADMIRALTY ACTION IN REM.
Journal of Maritime Law and Commerce, Vol 2, No 1, p 200-202, Oct 1970. 3 p, 9 ref.

Descriptors: *Federal jurisdiction, *Admiralty, *Ships, *Water pollution control, Pollution abatement, Pollutants, Water pollution sources, Water pollution effects, Federal government, State governments, Public benefits, Navigable waters, Sea water, Marine animals, Marine plants, Public rights, Damages, Impaired water quality, Administrative agencies, Environmental effects, Cost repayment, Legal aspects, Judicial decisions, Legislation, California.
Identifiers: Oil pollution.

This comment summarizes Department of Fish and Game v. Bournemouth, 307 F. Supp. 922 (C.D. Cal 1969), a decision of a United States district court holding defendant ship amenable to a maritime lien supporting an in rem admiralty action for the costs of abatement and damages arising from oil pollution of navigable waters of plaintiff state of California. The court held that the Admiralty Extension Act of 1964 did not give rise to a lien against the defendant. However, the court determined that under principles of general maritime law, it had jurisdiction to impose a lien against the defendant. Noting that the injury in question was to the water itself and that maritime liens generally arise from collisions or personal injuries, the court held that efforts to distinguish between various types of property would be useless. The court noted that, in light of the growing incidence of oil pollution of navigable waters by ships, the public interest is best protected by the imposition of maritime liens against the offending vessel. THE ECUADOR FISHERIES DISPUTE (A NEW APPROACH TO AN OLD PROBLEM),
Daniel C. Lecuona.
Journal of Maritime Law and Commerce, Vol 2, No 1, p 91-114, Oct 1970. 24 p, 137 ref.

Descriptors: *International law, *Marine fisheries, *Law of the sea, *International waters, Commercial fishing, International commissions, Treaties, United Nations, United States, Oceans, Beds, Fishing, Conservation, Legal aspects, Fisheries.
Identifiers: *Ecuador, *Territorial sea.

Discussing the dispute over fishing rights in the Pacific Ocean off the coast of Ecuador, this article first discusses the historical basis for nations' claims to territorial waters, controversies that have arisen, and trends toward expansion of the territorial limit. It is the general consensus that a nation has exclusive fishing rights in what is determined to be its territorial sea and in the sea bed and sub-soil under the territorial sea. Ecuador claims sovereignty to a distance of 200 miles, while the United States recognizes a 12-mile limit. In considering the positions of Ecuador and the United States, the author concludes that Ecuador's position is not in opposition to historically recognized legal principles. The problem is that it is in the interests of smaller nations to claim a large territorial sea while it is in the interests of larger nations to assert a narrow one. Factors influencing such preferences include the relative sizes of national fishing fleets and the availability of fish in various areas. The author notes that Ecuador has been willing to negotiate fishing rights and concludes that there will be accommodation in this area when larger nations recognize the legitimate interests of smaller nations. (Duss-Florida)

ATTORNEY GENERAL'S OPINION ON CONFLICT BETWEEN FLORIDA AIR AND WATER POLLUTION CONTROL ACT AND OIL SPILL PREVENTION AND POLLUTION CONTROL ACT.
Florida State Dept. of Legal Affairs, Tallahassee.

1970 Florida Attorney General Opinions, No 070-121, Sept 2, 1970. 6 p.

Descriptors: *Florida, *Legislation, *Pollution abatement, *Administrative agencies, State governments, Administrative decisions, Water pollution, Water pollution control, Pollutants, Public health, Air pollution, Oil, Oily water, Legal aspects.

This opinion of the Florida Attorney General answers the following questions: (1) does the Oil Spill and Pollution Control Act (Chapter 70-244) conflict with the Air and Water Pollution Control Act (Chapter 403); (2) if this legislation conflicts, which agency has responsibility for conflicts in the area; (3) does Chapter 70-244 conflict with the 1969 Governmental Reorganization Act. Responding to question 1, it was observed that where there is comprehensive legislation like Chapter 403, and a later act applies only to a particular aspect of the same subject, the statute relating to a particular part operates as an exception to the general law. The Attorney General concluded that there was no conflict. The Attorney General noted that the agencies should cooperate in favor of the public interest, but that if a conflict arose the later act would prevail. Since a response to question 3 would involve passing on a matter of legislative discretion, the Attorney General declined to answer it. He stated that the Department of Air and Water Pollution Control is the actual pollution control agency of Florida, subject to the exceptions in Chapter 70-244 relating to oil and other pollutants spilled in the coastal areas subject to control of the Department of Natural Resources. (Hart-Florida)

ADARAY REALTY CORP V FABI (RESTORATION OF UPLAND TITLE I FILLING SUBMERGED LAND).
235 NYS 660-661 (Sup Ct App Div 1929).

Descriptors: *New York, *Riparian land, *Lan fills, *Ownership of beds, Riparian waters, Ripari rights, Dredging, Land forming, Beds, Shor Seashores, Oceans, Beach erosion, Banks, Ba erosion, Erosion, Land tenure, Boundaries (P perty), Boundary disputes, Legal aspects, Judic decisions.

Plaintiff realtor brought action against defend riparian owner to settle a dispute over boundar of property subject to a sale contract in which fendant was vendor. Plaintiff contended that defe dant's title was defective because a large part of fendant's upland had been lost due to croachment by the ocean at the time of contra execution. Defendant contended that his title h been restored, since the city had filled in the la prior to the closing date. The Supreme Court

ew York noted that one holding title to sub-erged land could restore his upland by filling, hereas title to land vested in the state could not be ained by filling. The court held that plaintiff failed prove that title to the submerged land was in the ate rather than defendant and thus failed to show at defendant could not restore his upland by ling. Judgment for defendant was affirmed. (Lip-k-Florida)

SUMMARY OF MASSACHUSETTS STATE WS, POLICIES AND PROGRAMS PERTAIN-TO WATER AND RELATED LAND SOURCES.
sachusetts Water Resources Commission, on. Div. of Water Resources.

9. 127 p, 2 chart.

criptors: *Massachusetts, *water resources, ter law, *Water policy, Development, Legal cts, Project purposes, Project planning, ning, Administration, Administrative agencies, -state commissions, River basin commissions, ershed management, Water quality control, Ju-l decisions, Legislation, Riparian rights, Con-ation, Land, Financing, Eminent domain, ic rights.

zing constitutional and statutory provisions, 12 rtant state court decisions, and several signifi-attorny general opinions, this report contains a psis of all Massachusetts law relative to water rces. Included in the report are discussions of: he state's riparian rights doctrine, (2) private public rights in surface and groundwater, (3) ss to lakes and streams, (4) interbasin diver-, and (5) eminent domain problems. The re-lists the projects for which permits or approval eeded and the responsible agency's function in ing such permits. Also described, along with a chart of the state government and a reorganization of state agencies to be implemented in 1971, are the organization and functions of four interstate and 21 state commissions and agencies having jurisdiction over water resources problems. Different policy and management approaches and concepts are discussed and compared. The report describes also programs in research, data collection and interpretation, planning, construction and development, regulation, drainage, irrigation, erosion control, and reservoir sites. The report discusses projections of policy, program trends, and future financing prospects, and concludes with a summary of water management problems in the areas of water supply, flood control, forestry and watershed management, hydropower, water quality control, and recreation. Specific recommendations for solving some of these problems are presented. (Liptak-Florida)

HAYNIE V MAY (TITLE TO ACCRETED LANDS WHEN ADJACENT UPLAND IS CONVEYED).

252 NW 749-754 (Iowa 1934).

Descriptors: *Iowa, *Accretion (Legal aspects), *Missouri River, *Boundary disputes, Boundaries (Property), Contracts, Adjudication procedure, Legal aspects, Judicial decisions, Real property, Land tenure, Navigable waters.

In a suit to quiet title to riparian land, the Supreme Court of Iowa stated that by recording his deed and plat, and holding himself out as the owner of the disputed land, plaintiff had acquiesced in the description of the property in the deed although a court would have decided title to the accretions differently. In a later contract for sale of the same land utilizing the identical description, plaintiff was held to have conveyed title to the accretions as well as the upland. (Hart-Florida)

LOUISIANA V MISSISSIPPI (BOUNDARY DISPUTE BETWEEN STATES, INVOLVING ACCRETION AND SUBSEQUENT AVULSION).
282 US 458, 51 S Ct 197-201 (1931).

Descriptors: *Louisiana, *Mississippi, *Accretion (Legal aspects), *Boundary disputes, Local governments, Judicial decisions, Remedies, Legal aspects, Mississippi River, Navigable rivers, Navigable waters, Islands, Channel erosion, Banks, Bank erosion, Avulsion, Boundaries (Property), Interstate rivers.

Louisiana brought suit to determine the location of the boundary between a portion of Louisiana and a portion of Mississippi. Louisiana contended that the thread of the Mississippi River channel had moved gradually eastward between 1823 and 1913, with an island disappearing and land accreting to the Louisiana shore and becoming part of Louisiana. An avulsion in 1912 to 1913 changed the channel westward, cutting off the land that had previously attached to Louisiana. Louisiana claimed that the avulsion did not change the boundary previously formed by accretion. Mississippi agreed that the 1912-1913 avulsion did not change the boundary, but contended that the earlier eastward movement of the river channel was an avulsion rather than accretion, thus the land had remained in Mississippi. The Supreme Court of the United States, in accepting a master's report, held the eastward change was by accretion, thus Louisiana gained the Land. The court also noted that evidence was inconclusive to show Mississippi had exercised continued dominion over the land or that Louisiana had acquiesced in any such dominion. (Morris-Florida)
W71-05117

NEW JERSEY V CITY OF NEW YORK (CITY DUMPING GARBAGE IN OCEAN AS NUISANCE).
283 US 473, 51 Sup Ct 519-522 (1931).

Descriptors: *New Jersey, *Domestic wastes, *Water pollution, *Water pollution effects, Water pollution sources, Water pollution control, Pollution abatement, Pollution identification, Legal aspects, Judicial decisions, Remedies, Permits, State governments, Local governments, Garbage dumps, Municipal wastes, Incineration, Oceans, Atlantic Ocean, Beaches, Shores, Cities.

Plaintiff state sought to enjoin defendant city from dumping garbage in the ocean. Plaintiff claimed the garbage washed ashore on its beaches, causing a health menace and great expense to the state and its resorts. Defendant asserted that the dumping was done under federal permit and outside the territorial waters of the United States and thus was outside the Court's authority. Defendant also claimed that other sources also dumped waste in the same area and that it would be impossible to attribute the injury to defendant. The Supreme Court of the United States accepted a master's finding that the garbage did constitute a nuisance and that the defendant was the primary source of the garbage. The Court also noted that defendant had been aware of the nuisance for years and had not acted sufficiently to remove it, although defendant also used some incinerators to destroy garbage. The Court held that the permit did not relieve defendant of liability for a nuisance and that the situs of the dumping was unimportant since the site of the injury and both parties were within the Court's jurisdiction. SMOOT SAND AND GRAVEL CORP V WASHINGTON AIRPORT, INC (BOUNDARY DISPUTES BETWEEN STATES ON THE POTOMAC RIVER).
283 US 348, 51 Sup Ct 474-476 (1931).

Descriptors: *Virginia, *Maryland, *Boundary disputes, *Interstate rivers, District of Columbia, Local governments, Federal government, Legal aspects, Judicial decisions, High water mark, Low water mark, Legislation, Boundaries (Property), Riparian land, Navigable waters, Banks, Rivers.
Identifiers: *Potomac River.

Plaintiff airport sought to enjoin defendant gravel corporation from trespassing on land between the high and low water marks on the Virginia side of the Potomac River, opposite the District of Columbia. Plaintiff brought suit in Virginia, but a federal district court dismissed for lack of jurisdiction over the area. The question which faced the Supreme Court of the United States was whether the boundary line between Virginia and the District of Columbia is the high or low water mark on the Virginia side of the Potomac. The Court held that the original conveyance to Lord Baltimore was along the farther bank of the river, which would mean the high water mark. Thus the Court held that Virginia courts would not have jurisdiction over the area. A dissenting opinion claimed the decision was contrary to the Court's earlier holding that the Compact of 1785 between Virginia and Maryland set Maryland's southern boundary at the low water mark of

the south bank of the Potomac. The District retained Maryland's boundary when it was created. (Morris-Florida)

VERMONT V NEW HAMPSHIRE (BOUNDARY DISPUTE INVOLVING RIVER BETWEEN STATES).

289 US 593, 53 Sup Ct 708-718 (1933).

Descriptors: *Vermont, *New Hampshire, *Boundary disputes, *Interstate rivers, Low water mark, High water mark, Legal aspects, Judicial decisions, Local governments, Federal government, Boundaries (Property), Legislation, Navigable waters, Navigable rivers, Rivers, Banks, Riparian land, River beds, Ownership of beds, Vegetation, Shoreline cover.

The state of Vermont brought a suit to determine the boundary line between Vermont and the state of Massachusetts. Vermont asserted the boundary should be the thread of the channel of the Connecticut River. Massachusetts claimed the boundary should be the top of the western bank of the river, which would mean the line where vegetation ceases. Both states relied on various historical and colonial documents, but no dispute had occurred between them until New Hampshire attempted to tax corporations and persons with structures on the west bank. A special master concluded that the ordinary low water mark on the western side of the river was the proper boundary. The master based his opinion on the congressional resolution of 1781 setting terms for Vermont's admission to the Union and the Vermont legislature's resolution of 1782 relinquishing claims east of the low water mark in accordance with congressional wishes. The Supreme Court of the United States adopted the master's report, based on the acts of the states and their inhabitants in relying on the low-water mark for over 100 years. (Morris-Florida)

NEW JERSEY V CITY OF NEW YORK (REMEDY AGAINST CITY FOR POLLUTION OF STATE WATERS AND BEACHES).
290 US 237, 54 Sup Ct 136-137 (1933).

Descriptors: *New Jersey, *Water pollution, *Domestic wastes, *Waste disposal, Oceans, Shores, Coasts, Cities, Beaches, Incinerators, Damages, Remedies, Costs, Wastes, Judicial decisions, Legal aspects, Water pollution sources, New York.

Plaintiff state of New Jersey sought to enjoin defendant city of New York from dumping garbage into the ocean, thereby polluting New Jersey waters and beaches. The Supreme Court of the United States appointed a special master to hear the case. The master found that defendant had created and was continuing to create a public nuisance and that plaintiff was entitled to the relief prayed for. He recommended that defendant be given a reasonable time in which to install incinerators to dispose of its garbage. The Court approved the master's report and issued a decree specifying a time after which the injunction would take effect. Defendant failed to install the incinerators in time to comply with the decree, and plaintiff filed a petition asking defendant to show cause why it should not be held in contempt. Defendant answered that inadequate financial means had caused the delay and prayed for an extension. The Supreme Court granted the extension, awarded damages to plaintiff for expenditures by its political subdivisions in dealing with the pollution, and provided for a daily penalty if defendant did not comply with the decree within the new time limit. NEW JERSEY V CITY OF NEW YORK (OFFSHORE SEWAGE SLUDGE DISPOSAL).
296 US 259, 56 Sup Ct 188 (1935).

Descriptors: *New Jersey, *New York, *Sewage disposal, *Waste disposal, Waste water disposal, Municipal wastes, Sanitary engineering, Sludge disposal, Waste dumps, Wastes, Legal aspects, Judicial decisions, Cities, Water pollution, Adjudication procedure, Water pollution control.

Plaintiff state obtained an injunction prohibiting defendant municipality from dumping refuse into the ocean waters off the coast of plaintiff. Defendant dumped nonfloating sewage sludge consisting of 90 percent water and 10 percent finely divided solids at places not less than 10 miles from plaintiff's shore. Defendant filed a petition for construction or modification of the injunction decree to determine if defendant had violated the court order. The United States Supreme Court held that the dumping of sludge, free from any matter capable of floating, was not a violation of the decree. (Powell-Florida)

PROPERTY: THE FIXED LAW OF CHANGING BOUNDARIES,
Douglas H. Lefeve, and Ernest G. Taylor.
Mississippi Law Journal, Vol 41, No 2, p 444-456, 1970. 13 p, 96 ref.

Descriptors: *Boundaries (Property), *Accretion (Legal aspects), *Avulsion, *Thalweg, Boundary disputes, Bank erosion, Riparian land, Riparian rights, Riparian waters, Judicial decisions, Legal aspects, Rivers, Navigable rivers, Streams, Mississippi River, Prescriptive rights, Adjudication procedure.

In this note pertaining to changes in size and shape of land bordered by a river or stream, the following riparian doctrines are discussed: (1) accretion, (2) thalweg, (3) avulsion, and (4) prescription and acquiescence. Accretion is defined as an imperceptible increase in riparian land by either natural or artificial means. The author states that title to an accretion is vested in the riparian owner whose land to which it attached. The origin and justifications for the accretion doctrine are analyzed. Thalweg is defined as the middle or thread of a navigable river forming the boundary between coterminous states. Since the thalweg changes continuously, the author notes that the states' boundary varies with it. This prevents one state from excluding the other from its right of navigation. Avulsion is defined as a stream's sudden departure from its old bed into a new one. It is stated that avulsion causes no legal change in boundaries. The prescription and acquiescence doctrine allows a state to acquire land originally belonging to another. The procedural problems of litigation and disputes are discussed, and the author concludes that the avulsion rule should be eliminated. (Hart-Florida)

COUNCIL ON ENVIRONMENTAL QUALITY; STATEMENTS ON PROPOSED FEDERAL ACTION AFFECTING THE ENVIRONMENT.
Federal Register, Vol 36, No 19, Thursday, January 28, 1971, p 1398-1402.

Descriptors: *Environmental effects, *Administrative agencies, *Project planning, *Decision making, Conservation, Federal government, United States, Administration, Planning, Natural resources, Legislation, Water resources development, Adoption of practices, Legal aspects, Governments, Costs, Jurisdiction.
Identifiers: *National Environmental Quality Act.

To implement the purposes of the National Environmental Quality Act, the Council on Environmental Quality herein proposes guidelines for the preparation of statements on proposed federal action affecting the environment. The Act requires all federal agencies anticipating proposals for legislation, or other agency action having potential effect on the quality of the environment, to prepare a detailed statement outlining the environmental impact of the proposal. The guidelines describe agency procedures, which actions are considered with the Act, and which agencies are responsible preparing statements. Statements are to include probable impact of the proposed action on the vironment, adverse environmental effects w cannot be avoided, analysis and costs of alterna action, the relationship between short-term long-term effects of the action, any irrever committments of resources involved in the act and any discussion or objection raised by o federal, state, or local agencies. Federal agen having jurisdiction or expertise in certain a must be consulted and are listed in an appen Action should not be taken until the Council had at least 90 days to consider the statement. procedure also allows for state and local rev public hearings and public dissemination of the vironmental statements. SOME LEGAL PROBLEMS INVOLVED IN SA ING GEORGIA'S MARSHLANDS,
Fiquilliat and Abbot, Savannah, Ga.
Laurie K. Abbott.
Georgia State Bar Journal, Vol 7, No 1, p 27- 1970. 10 p.

Descriptors: *Georgia, *Marshes, *Estuar *Tidal marshes, Legal aspects, Legislation, A ministrative agencies, State governments, La reclamation, Marsh management, Judicial de sions, Eminent domain, Coordination, Perm Land fills, Real property, Land tenure, Dredging

There are many conflicting uses for Georg coastal marshlands. This article examines the le difficulties involved in conserving th marshlands. An act in 1860 extended title from uplands to the low water mark of adjacent navi ble streams; accordingly, holders contiguous to marshlands considered them their own. Howeve later Georgia Supreme Court decision held that act did not apply to marshlands. This defect w

ired by legislation and a constitutional amendent. In 1970, the Georgia Attorney General held at the marshlands belonged to the state. The thor analyzes the Attorney General's opinion, ncluding that its foundation is tenuous. Next, the thor examines the Coastal Marshlands Protecn Act which requires a permit from the Coastal arshlands Protection Agency for dredging and ing in the marshlands. It is stated that this act ist withstand three tests: (1) Can zoning power delegated to a state agency; (2) Is the agency's usal to grant a permit an uncompensated taking thout due process; and (3) Is a permit applicant orded due process by the procedures set forth in act. criptors: *Navigable waters, *Waste disposal, mits, *Rivers and Harbors Act, Administra- Wastes, Environmental effects, Conservation, ed States, Natural resources, Legislation, ulation, Water quality, Administrative agen- Project planning, Decision making, Adoption ractices, Water pollution control, Pollution ement, Effluents, Waste water (Pollution), er quality control, Pollutants, Administrative ions, State governments
tifiers: Administrative regulations.

uant to Executive Order 11574 directing the ementation of a permit program under the se Act, the Secretary of the Army herein oses the policy, practice, and procedure to be wed by the Corps of Engineers in granting perauthorizing the discharge of refuse or other er into United States navigable waters. As a ral policy, all discharges into navigable waters nlawful and will only be authorized after an ation of the probable impact on: (1) orage and navigation, (2) applicable water ty standards, and (3) fish and wildlife. The s will not issue a permit where the state has decertification under the Federal Water Pollution Control Act, and the findings of the Environmental Protection Agency as to probable impact upon water quality standards will be followed. Permit applicants must supply specified information on the character of the proposed discharge and must also furnish state certification. The Corps will furnish copies of the application to the EPA and other interested agencies for their views and recommendation. The Corps shall give public notice of the application and may hold a public hearing. If the discharge will have a significant environmental impact, the Corps must submit an environmental impact statement to the Council on Environmental Quality. Permits may not be issued for more than 5 years without providing for revalidation. (Liptak-Florida)

DEEP SEA MINING,
F. M. Auburn.
American Bar Association Journal, Vol 56, p 975-976, 1970. 2 p, 7 ref.

Descriptors: *International law, *Continental Shelf, *Continental Margin, *Exploitation, Law of the sea, International waters, Mining, Regime, Regulation, Beds under water, Administrative agencies, Administration, Jurisdiction, United States, United Nations, Federal government, Governments, Oil industry, Treaties, Political aspects, Political constraints, Institutional constraints, Boundary disputes, Legal aspects, Judicial decisions.
Identifiers: *Deep sea mining.

Evaluated in this article are recent proposals, United Nations proceedings, and court decisions relating to exploitation of the ocean bed, Continental Shelf, and Continental Margin. Three United Nations resolutions dealing with this area are considered. Concurrent, and often conflicting, developments within the United States are reviewed. The views of the American Petroleum Institute, the United States Navy, the Department of the Interior, and the federal courts are compared with attempts to establish international regimes to govern such areas. The author suggests that a recent proposal by President Nixon may serve as a basis for resolving both international and domestic conflicts in the area of deep-sea exploitation. The Nixon Proposal of May 25, 1970, suggests an international treaty renouncing all national claims to sea-bed resources below 200 meters. It would provide for: (1) an international regime to exploit such resources, (2) coastal states to act as trustees, and (3) machinery to regulate exploitation beyond the Continental Margin. The proposal is examined and evaluated by the author, who suggests possible amendments. (Earl-Florida)

WATER RESOURCES COUNCIL; COUNCIL ORGANIZATION.
Water Resources Council, Washington, D.C.

Federal Register, Vol 35, No 146, Wednesday, July 29, 1970, p 12105-12113.

Descriptors: *Water Resources Planning Act, *Administrative agencies, *Grants, *Administrative decisions, Federal government, Adoption of practices, Institutional constraints, Inter-agency cooperation, Decision making, Leadership, Organizations, Regulations, Coordination, Management, Personnel management, Project-planning, Federal project policy, Water resources, Legislation, Allotments, Legal aspects.
Identifiers: *Water Resources Council.

Set forth in this administrative promulgation is a description of the organizational structure, functions, and grant procedures of the Water Resources Council. The Council's basic authority under the Water Resources Planning Act, its purposes, functions, organizational pattern, and office locations are set forth. The responsibilities and structure of the Council are described, including: (1) the Council itself; (2) decisions by members and representatives; (3) the role of associate members and observers; (4) subordinate groups, (5) the Secretary, Chairman, Director, and other officers; (6) official decisions; and (7) delegation of the Director's powers. The Council's field organization, including field directors, field committees, and existing committees, is also set forth. Council regulations and procedures applicable to grants to the states under the Water Resources Planning Act are provided, listing: (1) allotment criteria; (2) application procedures; (3) federal agency coordination considerations; (4) annual reporting and review requirements; and (5) other grant standards and regulations. RECLAMATION AND IRRIGATION OF LANDS BY FEDERAL GOVERNMENT.

43 USCA secs 425 thru 425b, 616 mmmm thru 616 yyyy (Supp 1970).

Descriptors: *Irrigation programs, *Irrigable land, *Federal project policy, *Federal reclamation law, Arid lands, Legal aspects, Public lands, Reclamation, Irrigated land, Irrigation, Irrigation effects, Irrigation systems, Irrigation water, Administrative agencies, Federal government, State governments, Local governments, Cities, Recreation, Wildlife conservation, Fish conservation, Cost repayment, Oregon, Washington, Legislation, State governments.
Identifiers: *Federal Water Project Recreation Act.

Those provisions of federal reclamation laws which limit the acreage of irrigable land which may receive irrigation benefits shall not be applicable to lands owned by states, political subdivisions and agencies thereof, so long as such lands are farmed as herein provided. Under the conditions here set forth, irrigable state-owned lands may receive water from federal reclamation projects. Lessees of state-owned irrigable lands which are subject to the acreage limitation may receive project waters for up to a limit of 25 years. This act also authorizes the construction, operation and maintenance of: (1) the Merlin Division of the Rogue River Project in Oregon, and (2) the Touchet Division of the Walla Walla Project in Oregon and Washington. Standards are prescribed for these projects. In both projects conservation and the development of fish and wildlife resources, and the enhancement of recreation opportunities, shall be in accordance with the Federal Water Project Recreation Act. Irrigation repayment contracts must provide for cost repayment within 50 years. (Hart-Florida)

SHELDON V SEVIGNY (BOUNDARY OF PROPERTY ABUTTING ON A STREAM).

272 A2d 134-137 (NH 1970).

Descriptors: *Streams, *Boundary disputes, *Boundaries (Property), *New Hampshire, Surveys, Land tenure, Real property, Zoning, Septic tanks, Cities, Legal aspects, Judicial decisions.

Plaintiff landowner brought action to prevent defendant adjacent landowner from installing a septic tank within the confines of plaintiff's land and thereby violating a zoning ordinance. The case evolved into a boundary dispute between the two lots purchased from a common grantor. Both deeds described the common boundary as running along the bank of a brook. Plaintiff contended that the

surveyor's measurements were from the thread of the brook when they should have been from the bank. Defendant supported the survey. The court stated that in the absence of a clearly expressed intent to limit a grant to the bank, title runs to the thread of the stream. Since no such intent was found, the court rejected plaintiff's contention. (Hart-Florida)

REGULATION OF TRANSPORTATION IN INTERSTATE OR FOREIGN COMMERCE OF BLACK BASS AND OTHER FISH.
16 USCA secs 851 thru 852d (Supp 1970).

Descriptors: *Fish, *Transportation, *Bass, *Fish conservation, Legislation, Administrative agencies, Foreign countries, Federal government, Regulation.
Identifiers: *Interstate commerce.

The transportation of any black bass or other fish in interstate or foreign commerce with knowledge that the transportation is contrary to the law of the state in which the fish originated, or that the fish were illegally caught, is prohibited. Moreover, purchasing or receiving any fish with knowledge that the fish were transported in violation of this act is unlawful. Receiving black bass or other fish with knowledge that a false record of the shipment was made is also unlawful. Containers in which fish are shipped must be conspicuously marked 'fish', and the name and address of the shipper and the consignee must be included. Employees of the Department of the Interior are authorized to enforce the act and are empowered: (1) to arrest without a warrant any person violating the provisions in his presence; (2) to execute any warrants issued to enforce the act; and (3) to make searches under a valid warrant. Warrants may be issued upon probable cause. (Hart-Florida)

MARTIN V BUSCH (OWNERSHIP OF LAKEBEDS RELICTED BY STATE DRAINAGE OPERATION).
112 So 274-288 (Fla 1927).

Descriptors: *Florida, *Land tenure, *Ownership of beds, *Boundary disputes, Boundaries (Property), Beds under water, Beds, Lakes, Littoral, Navigable waters, Riparian land, Riparian rights, Accretion (Legal aspects), Administrative agencies, Real property, State governments, Reservation doctrine, Judicial decisions, Legal aspects, High water mark.

Plaintiff swampland owner sought to quiet title to lands against claims of defendant Florida Improvement Fund trustees. The disputed land was coveyed to plaintiff's predecessor by defendant before Lake Okeechobee was meandered. The boundary of the conveyance was Lake Okeechobee. After the conveyance, defendants had the lake meandered. Due to a drainage operation by the state, the lake had receded. Both parties claimed the land between the high water mark at the time of the conveyance and the meander line. The Supreme Court of Florida stated that: (1) 'navigable waters' include all waters capable of practical navigation for useful purposes; (2) on admission to the Union, the state became owner of beds of navigable lakes to high water mark; (3) best evidence and methods should be used to determine the location of the high water mark; (4) lands below high water mark are 'sovereignty lands,' while those above are 'swamp lands'; and (5) right to land below high water mark must be specifically claimed. The court further noted that relicted land does not inure to a riparian owner where it recedes as a result of a state drainage operation for a public purpose. Since defendant had no authority to convey beds of navigable waters, the court held title in defendant. (Hart-Florida)

29 F2d 932-949 (D NJ 1928).

Descriptors: *New Jersey, *Docks, *Land tenure, *Ownership of beds, Beds, Beds under water, Cities, State governments, Hudson River, Rivers, Navigable rivers, United States, Taxes, Legal aspects, Judicial decisions.

Plaintiff United States brought action to have realty located within defendant city declared permanently tax exempt. The property was a portion of the Hudson River's bed which had been conveyed to a German Steamship line by defendant. A convenant in the conveyance prohibited erection of any structure which would obstruct public view. However, the steamship company had erec docks on the property. Plaintiff condemned property under a statute allowing condemnation German property during World War I. The par agreed that plaintiff was exempt from taxation, defendant contended that plaintiff did not own property when the tax was imposed, because taking was unconstitutional. Defendant's cont tion was rejected by the United States distr court. However, the court observed that the c veyance had apparently been broken, and that parently the state of New Jersey, which originally conveyed the land to defendant, ha right of re-entry. COLE V AUSTIN (SUBMERGED FERR CABLE AS OBSTRUCTION TO NAVIGATION).
140 A 108-114 (Conn 1928).

Descriptors: *Connecticut, *Navigable waters *Navigation, *Boats, Islands, Piers, Riparian land Riparian waters, Riparian rights, Public rights Legal aspects, Judicial decisions.
Identifiers: Nuisance (Public).

in an action to quiet title to land, plaintiff riparian owner also sought to enjoin defendant from maintaining a ferry cable between defendant's island and the mainland. Plaintiff contended that the cable was a nuisance and an obstruction to navigation. Affirming a judgment for defendant, the court noted that a ferry cable does not obstruct navigation when, as in this case, it lay on the bottom and was only picked up by the ferry as it passed overhead. The court also noted that plaintiff had shown no special injury, different in kind from that suffered by the general public, and therefore could not maintain an action to enjoin a public nuisance. MIDDLESEX WATER CO V BOARD OF PUBLIC UTIL COMM'RS (WATER COMPANY'S DUTY TO MAINTAIN WATER SUPPLY SYSTEM).

140 A 254-256 (NJ 1928).

Descriptors: *New Jersey, *Public utilities, *Water supply, *Water rates, Public utility districts, Water distribution (Applied), Pipelines, Water costs, Costs, Water conveyance, Municipal water, Administrative decisions, Legal aspects, Judicial decisions, Permits, Government finance, Income.

Plaintiff water company sought to reverse an order of defendant public utilities board requiring plaintiff to install certain water mains. Plaintiff contended that the new water lines would not be any more efficient or effective than the old line and that defendant erred in projecting the cost and income so that plaintiff was unable to raise the capital to carry out the order. Affirming defendant's order, the court noted that plaintiff was under a legal duty to maintain an adequate municipal water supply and could not excuse noncompliance with the board's order on the ground of financial inability. Plaintiff had just been granted two rate increases which provided a sufficient return on its capital. (Liptak-Florida)

IN RE WATER FRONT IN TOMPKINSVILLE (APPEAL OF CONDEMNATION AWARDS FOR SUBMERGED LANDS).

249 App Div 382, 220 NYS 18-23 (Sup Ct 1927).

Descriptors: *New York, *Easements, *Condemnation, *Condemnation value, Eminent domain, Compensation, Contracts, Judicial decisions, Legal aspects, State governments, Cities, Permits, Piers, Beds, Beds under water, Access routes.

Appellant municipality condemned respondent's submerged lands. The original condemnation award did not consider appellant's easement in the submerged lands; therefore, appellant sought a lesser award in this appeal. The New York supreme court held that appellant's easement should have been considered in making the award, noting that appellant's easement included right of passage over natural or artificial accretions. Appellant also contended that respondent's land was restricted to construction of public wharves and docks, but this contention was rejected, as was appellant's contention that the condemnation plan itself should affect the award. Covenants providing that respondents would in event of condemnation accept the amount paid to appellant originally, plus the value of any improvements, were held valid and enforceable. The court found that awards for consequential damages and conjunctive use were proper. Although respondents were not engaged in proper activities to obtain a license for shedding the piers, it was held that valuation on the theory that a license could be obtained was proper. Furthermore, the court determined that the ability of vessels to berth on both sides of the dock was properly considered in making the award. (Hart-Florida)

KORROLL V BOARD OF TRUSTEES OF SCHOOL DISTRICT 24 (BOUNDARY DISPUTE UNDER DESCRIPTION EXTENDING TITLE TO BANK OF LAKE).
220 NW 413-414 (Minn 1928).

Descriptors: *Minnesota, *Lakes, *Boundary disputes, *Accretion (Legal aspects), Riparian rights, Boundaries (Property), Real property, Land tenure, Riparian land, Judicial decisions, Legal aspects, Meanders, Land.

Plaintiff riparian landowner sought a declaratory judgment to determine title to a reliction in front of defendant's land. Defendant's deed described his land as extending 'along the bank of the lake.' Plaintiff owned riparian land on both sides of defendant. It was stipulated that the lake was meandered. Plaintiff contended that defendant held title only to the bank, rather than the waterline. Hence it was asserted that defendant had no claim in the reliction. However, the Supreme Court of Minnesota construed defendant's deed to convey title to the waterline and dismissed the action. (Hart-Florida)
W71-05219

EMMONS V UTILITIES POWER CO (CONDEMNATION VALUE OF OVERFLOWED LAND).
141 A 65-70 (NH 1928).

Descriptors: *New Hampshire, *Condemnation value, *Power head, *Flooding, Dams, Hydroelectric plants, Hydroelectric power, Eminent domain, Design flood, Backwater, Riparian land, Rivers, Compensation, Payment, Conjunctive use, Adjudication procedure, Judicial decisions, Legal aspects, Condemnation, Value.

Plaintiff riparian landowner brought action for assessment of damages to land overflowed by the backwater from defendant's dam. Since a 26-ft. power head was created by the river over the length of plaintiff's land, it was especially adaptable for production of water power. Plaintiff contended that the jury should consider conjunctive use of the power head in awarding damages, while defendant asserted that concomitant use should not be a factor in the award. The Supreme Court of Massachusetts stated that: (1) undeveloped water power is a property right inherent in riparian ownership, and therefore compensable; (2) the compensation should equal the diminution in value caused by the flowage; (3) the land should be appraised for its most profitable use; and (4) enhanced value because of conjunctive use may be shown if it would enhance the market price in an arm's length sale. The Supreme Court of New Hampshire held that the lower court erred in refusing to admit evidence of enhanced value caused by conjunctive use. Additionally, it was noted that: (1) special utility may be shown to enhance value; (2) the measure of damages is not the value to condemnor, but the value undeveloped and uncombined with other property; and (3) no rule exists for apportioning values of property capable of development in the aggregate as one unit. (Hart-Florida)

POLITICAL AND INSTITUTIONAL ASPECTS OF THE EVALUATION OF WATER RESOURCES PROGRAMS,
Wisconsin Univ., Madison.
Irving Fox.
In: Evaluation Processes in Water Resources Planning, Urbana, Illinois, American Water Resources Association, p 89-100, July 1970.

Descriptors: *Economic evaluation, Water resource planning, Water law, Decision-making, Cost-benefit analysis, Political constraint, Cost sharing.
Identifiers: *Water institutions, Shoreland management, Social cost, Social benefits.

Water institutions operating in a political context influence the evaluation process for water resources planning, and more specifically the weighting of information bears upon choices among alternative programs. Water institutions are divided into two categories; the laws, policies and programs that influence private enterprise in the water field and the public agencies that formulate water policy and provide water services to the private sector. The example of shoreland management is used to focus attention on private decision-making. A hypothesis is formulated which states that under present laws, shorelands, primarily privately owned, do not serve the public interest since social costs and benefits are not considered in decision-making. The hypothesis is found to be correct with public agencies involved in the environmental degradation of shorelands. The author finds water resource agencies do not represent all sectors of society equitably in policy making with special interest groups receiving the greatest benefits. Possible solutions to the problem include use of multiple alternatives in the evaluation process, greater integration in decision-making and more research on public goals. (Siegenthaler-Rutgers)

IN RE PUBLIC BEACH IN CITY OF NEW YORK (TITLE TO LANDS UNDER WATER).

256 NY 156, 176 NE 5 (1931).

Desriptors: *New York, *Boundaries (Property), *Land tenure, *Ownership of beds, High water mark, Land, Legal aspects, Judicial decisions, Real property, Condemnation, Eminent domain, Damages, Recreation, Cities, Local governments, State governments, Boundary disputes, Oceans, Beaches, Shores, Seashores.

Plaintiff city of New York sought to condemn certain upland property and offshore lands for a public beach. Defendants, by virtue of a colonial grant conveying to 'the main ocean,' claimed ownership of the upland to the high water mark. By virtue of a state conveyance, defendants claimed ownership of the offshore land from the high water mark to a distance of 1200 feet into the ocean. The trial court awarded only nominal damages to plaintiff for lands below high water mark. The appellata court reversed and the Court of Appears of New York affirmed for defendant. The colonial grant to the main ocean conveyed title to the high water mark. The later grant by the state to the land below the high water mark entitled defendant to damages for taking by plaintiff city. (Dye-Florida)

IN RE JAMAICA BAY (COMPENSATION FOR CONDEMNATION OF RIPARIAN RIGHT OF ACCESS).
256 NY 382, 176 NE 539-543 (1931).

Descriptors: *New York, *Riparian rights, *Condemnation, *Access routes, Compensation, Eminent domain, Navigation, Cities, Local governments, Governments, Riparian land, Land, Real property, Legal aspects, Judicial decisions, Navigable waters, Public rights, Relative rights, Docks, Land use, Landfills, Land reclamation, Land forming.

Plaintiff city condemned lands for construction of a marginal street along a bay shore. Defendant landowners sought compensation for destruction of their riparian right of access to the bay. The Court of Appeals of New York reversed in part a judgment denying compensation to defendants. Riparian rights are held subject to the public right to improve navigation and commerce. Riparian owners denied access to the bay by construction of a marginal street for such purposes are not entitled to compensation. However, where plaintiff sought to fill a creek for the purpose of building public streets, compensation must be awarded. In the instant case the city's purpose in condeming and filling some of the property was unclear. If it was

found that part of the fill was intended to be used for public purposes unrelated to navigation, compensation should have been awarded those landowners whose riparian rights were restricted by the fill. (Dye-Florida)
W71-05235

CARR V BANGHART (PRESCRIPTIVE RIGHTS IN STATE LAND).
170 A 620-622 (NJ Ct Err and App 1934).

Descriptors: *New Jersey, *Land tenure, *Canals, *Contracts, Legislation, State governments, Real property, Presciptive rights, Judicial decisions, Legal aspects, Land.

Plaintiff grantee sued defendant grantor for breach of covenant in a general warranty deed. Plaintiff asserted that a portion of the land conveyed by defendant belonged to the state. The disputed portion was part of an abandoned canal. In the legislation authorizing construction of the canal, the state reserved to itself the remainder after a term of years in the canal company. The company abandoned the canal early, but the state's right of possession did not accure until the term's expiration. Defendant, a mere interloper, 'appropriated' the land. Since defendant had not occupied the land for the period of the statute of limitations for adverse possession, running from the time the state's right to possession accrued, the state's title was upheld. Accordingly, the New Jersey Court of Errors and Appeals held defendant liable for breach of covenant. (Hart-Florida)

JENKINS V UNITED STATES (LIABILITY OF UNITED STATES FOR TAKING GRAVEL FROM SAND BAR).
60 Ct C l 23-30 (1924).

Descriptors: *United States, *Mississippi River, *Compensation, *Dredging, Eminent domain, Condemnation, Payment, Administrative agencies, Navigation, Navigable rivers, Rivers, River beds, Sand bars, Banks, Bank erosion, Sands, Gravels, Channels, Channel erosion, Channel improvement, Riparian land, Riparian rights, Bank stabilization, Bank protection, Legal aspects, Judicial decisions.

Plaintiff riparian landowner sued defendant United States to recover the value of sand and gravel removed from an accretion to his land. Defendant had agreed when taking the gravel to make payment if liability attached. The gravel was used for bank protection at an entirely different location. Plaintiff contended that since the removal was not to improve navigability at that location, but solely to obtain the material, defendant must make compensation. Defendant asserted that its right to improve navigation was paramount to plaintiff's riparian ownership. The United States Court of Claims observed that since plaintiff conceded defendant's right to dredge the river to improve navigation without providing compensation, his argument was specious, because the right to compensation should not be determined by the utilization of the dredged material. Holding that plaintiff's ownership to the thread of the stream was subordinate to defendant's authority to improve navigation and that defendant's acts were not a compensable taking, the court dismissed plaintiff's petition. 6F. Nonstructural Alternatives

WISE USE OF FLOOD PLAINS.
New England River Basins Commission, Boston, Mass.

Interim Report, July, 1969. 34 p, 2 fig, 5 tab, 1 chart, 1 append.

Descriptors: *New England, *Flood protection, *Non-structural alternatives, *Flood plain zoning, Flood plains, Flood damage, Flood forecasting, Floodproofing, Floodways, River basin development, Building codes, Flood plain insurance, Regions, Floods, Legislation, Governments, Cities, Urbanization, Community development, Land use, Regulation, Legal aspects.

As a result of increasing flood losses despite substantial flood protection measures, the New England River Basins Commission established a task force to study alternative measures of flood control. This report concentrates on non-structural methods of flood plain management and summarizes existing state and federal programs and policies. The basic problem is the clash between the rivers' natural tendency to flood the plain and the economic pressures to develop these areas. The solution is to prohibit or control this development by zoning and building controls. The report narrates the experience and status of such programs in each of the six New England states. These states have employed a variety of general and special laws, executive orders, local zoning ordinances, building codes, and land acquisition programs. The report also examines progress on 16 recommendations of a federal task force on the problem. The two basic areas of federal activity are assistance in flood plain delineation, surveying, and mapping, and actual assistance programs including a new flood insurance program. Finally, the report reviews the alternatives and assistance available to individual communities in planning and management of their flood plains. The report concludes that a concerted effort to fully use available planning tools is necessary to slow the rate of uneconomic and dangerous development of flood plains and to provide an optimum program for reducing flood losses. FLOOD PLAIN MANAGEMENT AND FLOOD INSURANCE,
James E. Goddard.
In: Evaluation Processes in Water Resources Planning, Urbana, Illinois, American Water Resources Association, p 58-74, July 1970.

Descriptors: *Flood plain insurance, Hydrology, Economic evaluation, Risk.
Identifiers: *Flood plain management, Resource planning, Subsidy, Suboptimization, Actuarial rates, Flood plain regulation.

The evaluation of flood plain regulations and possible alternative uses of flood plans based on site advantages is discussed. There are three general approaches to dealing with the flood plain; namely flood protection, flood plain regulations and resource planning. The resource planning approach is involved with community goals and management opportunities and avoids problems of suboptimization. The Federally-assisted flood insurance program is described along with the land use and control measures. The author suggests refinements in Federal Flood Insurance to allow true risk rates. Flood loss reimbursement rates offer a high subsidy for houses at low elevations but neglect commercial activities in the same area. The subsidy makes economic evaluation of the flood insurance program difficult since benefits and costs accrue to different parties. The author concludes that flood insurance is effective but offers little prospect for reform. (Siegenthaler-Rutgers)

THE QUALITY OF THE URBAN ENVIRONMENT,
California Univ., Los Angeles.
Harvey Perloff.
Baltimore, Johns Hopkins Press, 1969. 332 p.

Descriptors: *Urban environment, Pollution, Decision-making, Urban planning, Rent, Water resource development, Natural resources.
Identifiers: Material balance, Externalities, Congestion transport facilities.

The results of a conference on the Urban Environment held in 1967 are presented. The objective of the conference was to evaluate the existing information sources and new information that would be needed for measurement of environmental change and to study public policy issues related to environmental improvements. The main purpose was to present concepts useful to scholars and policy makers. The papers report on research in progress and are, therefore, essentially progress reports. The first paper attempts to set up a decision-making framework for policy making on the urban environment. The papers on pollution demonstrate the interrelation between waste product and the urban environment. Other papers deal with urban space on a two and three dimensional basis. This book is relevant for water resource planners concerned with the impact of government water investment

xpenditures on the urban environment. Siegenthaler-Rutgers)

Identifiers: *Radar (Imaging), *Radar (Side-looking).

The effects of soil moisture are extremely difficult to separate from other terrain parameters influencing the radar return signal. Presently available dual polarized, K-band, side-looking imaging radars provide a capability for revealing a qualitative estimate of soil moisture content. When used as a supplement to aerial photography in temperate climates, radar imagery analysis can provide data for mapping regions of permafrost, and this process caould be accomplished regardless of weather or time of day. A systematic study was made of a number of anionic and cationic tracers in different terrains with distinct petrographic characteristics, allowance being made for the various physical and chemical parameters of the environment. The behavior of 12 tracers (Cr-51, Fe-59, Ca-45, Ag-110, Na-24, Cs-137, H-3, P-32, S-35, C-14, I-131, Br-82) was studied in six types of argillaceous rock (illite, vermiculite, interstratified illite-vermiculite, montmorillonite, attapulgite and kaolinite) and three sand types (siliceous, Calcareous and dolomitic) in the presence of three types of water (demineralized, sea-water and various spring waters). On the basis of the results obtained from 5000 tests and measurements made during this study, selection tables are given for using the tracer most suited to the characteristics of the terrain and the type of groundwater. Identifiers: *Snow, *Microwave spectroscopy, *Soils, Microwave spectroscopy, *Ocean waves, Microwaves Emissivity, Response Beaches, Sand, Surface roughness, Temperature, Brightness, Sedimentation, Sea ice, Salinity, Tables, Mathematical models, *Microwave radiometry, Littoral zones, Snowpack, Surf, Sea states, *Remote sensing.

Research consisted of a combination of field and laboratory investigations of the microwave emission characteristics of natural materials, and analytical modeling of the microwave radiation characteristics of selected materials to establish a better understanding of the physics of microwave emission. Field and laboratory investigations dealt with sediments, snow, ice, water and the coastal environment. Measurements were taken at observational wavelengths of 0.81 and 2.2 cm. Measurements of the littoral zone were taken to establish

the microwave emission characteristics of breakers, foaming water, spray, the swash zone, etc. High emissivities associated with foaming water in the surf zone prompted a laboratory experiment where foam was artificially generated and the microwave response monitored at 0.81 and 2.2 cm wavelengths as a function of percent of surface foam coverage. The results indicate that radiometric temperature depends strongly on the percentage of foam coverage and suggests that analytical models for predicting brightness temperatures of the open ocean must consider the percentage of surface covered by white caps. Laboratory measurements of the microwave response at 0.81 and 2.2 cm of fresh and sea water as a function of thermometric temperature show good agreement with emissivity values computed by investigators at Texas A and M University. The microwave emission characteristics of fresh and sea ice as a function if ice growth were investigated in the laboratory. Distinct differences in the response of fresh ice and sea ice are apparent during initial ice growth. Further measurements at longer wavelengths are indicated to fully evaluate the potential of microwave radiometry for distinguishing sea ice types. Additional research concerning emission characteristics of sediments was accomplished. This work was concerned with the relationship between moisture content and microwave emission. Experiments were conducted for two types of sediments. A beach sand water table fluctuation experiment was also performed.

F. A. Waltz, and V. I. Myers.
Available from NTIS as PB-195 451, $3.00 in paper copy, $0.95 in microfiche. Geological Survey Interagency Report USGS-202, June 1970. 60 p, 20 fig, 12 graph, 28 tab, 1 ref, 4 append. USGS Grant 14-08-0001-G-25.

Descriptors: *Remote sensing, *Satellites (Artificial), *Soil moisture, *Soil-water-plant relationships, Data processing, Data transmission, Photography, Soil properties, Infrared radiation, Statistical methods, Soil moisture meters, Microclimatology.
Identifiers: Soil moisture surveys.

A data handling system is proposed for measuring and disseminating cropland soil moisture information from ERTS spacecraft. Large significant correlations were found between optical density measured on aerial film and soil water content measured by neutron probe methods, and between ground temperatures as measured through infrared thermal scanner techniques and soil water content of fallow or bare soil. Least square analyses of variance indicated crop types, time, and the interaction of crops as highly significant sources of variation. Pattern recognition of different crops is possible using densitometry measurements if the extraneous variation can be controlled, measured, or removed. Soil water content, plant water content, and available soil water must be measured. (Knapp-USGS)

Identifiers: *Particle size analysis.

A multipass filtering apparatus costs less than $40.00, and it can be built in less than two days. The apparatus is loaded with a series of screens different mesh size through which a measu volume of water is passed. Suitable screen material is available in mesh sizes ranging from microns to more than 1,500 microns. Disks (mm) can be cut from the cloth easily. The series mesh sizes most useful for analyzing the suspend particles of the Chesapeake Bay is 102, 53, 25, 20 microns. Each of these screens is supported b disk of 1,558 micron mesh cloth. In addition to use to increase the precision of volume s statistics obtained from number size distributio the multipass filtering apparatus is useful for fr tionating samples of plankton. AIRBORNE TEMPERATURE SURVEYS LAKE MICHIGAN, OCTOBER, 1966 AND 196
Michigan Univ., Ann Arbor. Great Lakes Resear Div; and Naval Oceanographic Office, Washingt D.C.
V. E. Noble, and J. C. Wilkerson.
Limnology and Oceanography, Vol 15, No March 1970, p 289-296. 7 fig, 6 ref.

Descriptors: *Lake Michigan, Isotherms, Infrar radiation, *Remote sensing, *Temperature, Lak *Water temperature.
Identifiers: *Airborne temperature surveys, *Th mal gradient, Satellite data.

Low-altitude flights to map surface water tempe ture were carried out over Lake Michigan on October 1966 and 25 October 1967. During t 1966 flight, a strong surface water thermal gradie (4.4C/6,000 m) was observed. This gradient w accompanied by a distinct color change. Dynam height currents computed from a bathytherm graph transect through the gradient indicated northward current of the order of 10-12 cm/sec the gradient zone. The thermal structure persist for a week. A similar temperature gradient-col separation-dynamic height current feature was o served during 1967. Data from Nimbus meteorological satellite for 7 September and 6 O tober 1966 show a large, weak structure in t radiation temperature patterns that might be i terpreted as precursors of the temperature-curre structure. This thermal structure might be a recu ring seasonal characteristic of Lake Michigan. (padhyaya-Vanderbilt)

GREAT LAKES THERMAL STUDIES USIN INFRARED IMAGERY,
Department of Energy, Mines and Resource Burlington (Ontario). Canada Center for Inlan Waters.
R. K. Lane.
Limnology and Oceanography, Vol 15, No March, 1970, p 296-300. 5 fig, 2 ref.

Descriptors: *Temperature, *Lake Ontario, Gre Lakes, Infrared radiation, *Remote sensing, Lake Identifiers: *Thermal studies, Infrared imager Thermal bar, Airborne thermometry.

During spring to autumn, 1968, seven airborne su veys of western Lake Ontario were made with a infrared scanner. The sensor of the infrare scanner repeatedly scans a path normal to fligh across a 120 deg field of view detecting elec tromagnetic radiation in the 8-14 micron ban Spatial resolution is 16 m radians and therma resolution is estimated at 0.01C. Examples o mosaics of infrared imagery of the western end o Lake Ontario are used to demonstrate their valu in revealing detailed surface thermal patterns. Ad

itional data from airborne thermometry and ship-oard measurements confirm the interpretation of rge scale dynamic processes. Smaller scale nenomena such as internal wave patterns and nall eddies, are also interpretable. The problem of ealing with the attenuation effects of the at-osphere is more difficult, particularly since the anner views through a path length that changes a factor of 2 as it sweeps from nadir to 60 deg. ne use of atmospheric profile data, the air-water mperature difference, and a narrower band de-ctor offers the possibility for more quantitative ta. undaries of rare floods, such as a 100-year recur-nce interval flood which is widely used for nning and regulatory purposes, are ordinarily tted by engineering procedures. In this study od plain boundaries were interpreted on nchromatic, and color aerial photographs along ream in a glaciated area of southern Wisconsin. e accuracy of these boundaries was determined comparison at 29 cross sections with those of an ermediate Regional Flood plotted by the U. S. ny Corps of Engineers. Boundaries on both es of photography agreed with the engineering ndary at 28 percent of the cross sections, were hin 100 feet at 67 percent of the cross sections, within 300 feet at 95 percent of the cross sec-s. Flood plain boundaries were most accurately neated where physiographic landforms were l defined. The results indicate that airphoto in-retation can be a useful tool to delineate flood n boundaries where the lack of hydrologic data, e, and funds prohibit plotting boundaries by litional engineering methods. Descriptors: *Water well, *Wells, Casing, Photography, Remote sensing.
Identifiers: *Downhole photographs, Well condition evaluation, New well completions, Damaged wells, Junk in wells, Formation identification.

Photographs of wells in stereoscopic, three dimensional pairs, are used for evaluation of well conditions. The pictures provide accurate detail pictures from which determination can be made for remedial procedures or for inspection of a well from top to bottom. These stereoscopic photograph surveys are used for evaluation of new well completions, damaged well, junk in wells, and formation material identification. Incorporated in this paper are pictures of the groups made in wells. (Campbell-NWWA)

COMPARISON OF HYDROLOGICAL AND MATHEMATICAL METHODS IN ANALYSIS OF TRITIUM DATA,
Federal Experimental and Research Institute Arsenal, Vienna, and Technical High School, Vienna, Austria.
R. Konig, and J. Reitinger.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/50, p 787-800, 1970. 14 p, 4 fig, 8 ref.

Descriptors: *Sampling, *Tritium, Tracers, Hydrogeology, Statistical methods, Optimization, Groundwater movement, Water yield, Springs, Discharge (Water), Water balance, Water resources, Water resources development, Groundwater basins.
Identifiers: *Vienna (Austria).

Many tritium samples were recently taken in boreholes, springs and groundwater overflows in the southern Vienna Basin, Austria. The data were analyzed to determine whether the tritium data confirm existing hydrological models, whether the tritium data give new information about the hydrology of this region, and the proper number of samples and frequency of sampling. These questions are treated using statistical mathematical methods. The measured time series (isotopic data) are random samples. Statistical methods give optimum values for the time interval for sampling and the total time of sampling. (Knapp-USGS)

A COMPUTER-ORIENTED GENERALIZED POROSITY-LITHOLOGY INTERPRETATION OF NEUTRON, DENSITY AND SONIC LOGS,
Gulf Research and Development Co., Pittsburgh, Pa.
Martin H. Harris, and R. B. McCammon.
Journal of Petroleum Technology, p 239-248, February 1971. 10 p, 6 fig, 4 tab, 9 ref.

Descriptors: *Radioactive well logging, *Data processing, *Borehole geophysics, Stratigraphy, Porosity, Permeability, Density, Computers, Computer programs, Subsurface investigations.
Identifiers: *Sonic well logging, *Well log interpretation.

The linear bulk volume response equations for neutron, density and sonic logs are formulated to simultaneously determine porosity and lithology in sand-shale as well as carbonate lithologies. A fundamental problem in solving the response equations, that of the existence of nonunique solutions, is resolved. Nonunique solutions arise because the number of lithology and porosity terms that must be considered exceeds the number of response equations. The validity of the generalized equations and the minimum variance technique for resolving nonunique solutions is illustrated. (Knapp-USGS)

PROGRAM OF THE WATER RESOURCES DIVISION, TEXAS DISTRICT, FOR THE 1971 FISCAL YEAR AND SUMMARY OF DISTRICT ACTIVITIES DURING FISCAL YEAR 1970.
Geological Survey, Austin, Tex. Water Resources Div.

Geological Survey Information Bulletin, December 1970. 34 p, 1 map.

Descriptors: *Water resources, *Programs, *Project planning, *Reviews, *Texas, Surface water, Groundwater, Publications, Bibliographies, Hydrologic data, Streamflow, Runoff, Water yield, Gaging stations, Lakes, Reservoirs, Geology, Data collections, Projects, Project purposes, Aquifers, Water levels.
Identifiers: *Hydrologic data summary (1970 FY Tex), *Data collection plans (1971 FY Tex).

The program of the Water Resources Division in Texas consists of the collection of basic records through the hydrologic-data network, interpretive studies, and research. The basic-data records and the results of investigations are published by the Geological Survey or by cooperating agencies. This report summarizes the scheduled activities of the Water Resources Division in Texas for the fiscal year (July 1, 1970 to Jun 30, 1971) and district activities during fiscal year 1970 (July 1, 1969 to

June 30, 1970). A significant activity in the Texas District is the collection of basic hydrologic data. Continuing series of measurements are made of streamflow, reservoir contents, chemical quality of water, sediment in streams and reservoirs, water levels in wells, and land-surface subsidence. Modern computer techniques are being used successfully in the collection and publication of water data. By the end of the 1971 fiscal year, the following installations will be in operation: Approximately 220 digital recorders at stream-gaging stations; 20 conductivity recorders; and one instrument for continuously and simultaneously monitoring and recording the water-quality characteristics of conductivity, water temperature, dissolved oxygen and pH. The use of electronic data processing for printing and storing water records will be expanded. (Woodard-USGS)

EVALUATION OF THE STREAMFLOW DATA PROGRAM FOR ARKANSAS,
Geological Survey, Little Rock, Ark.
James L. Patterson.
For sale by Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $3.75. Geological Survey Research 1970, Chapter D, Professional Paper 700-D, p D244-D256, 1970. 13 p, 1 fig, 5 tab, 8 ref.

Descriptors: *Data collections, *Streamflow, *Arkansas, *Hydrologic data, Streamflow forecasting, Peak discharge, Low flow, Floods, Stage-discharge relations, Stream gages, Gaging stations, Networks, Hydrology, Sedimentation, Planning, Evaluation, Discharge (Water).
Identifiers: Streamflow data.

An evaluation of the streamflow data available in Arkansas was made to provide guidelines for planning. The basic steps in the evaluation procedure were (1) definition of the long-term goals of the streamflow data program in quantitative form, (2) examination and analysis of available data to determine which goals have already been met, and (3) consideration of alternate programs and techniques to meet the objectives. Since many of the goals could be met by generalization of the data for gaged basins by regression analysis, significant changes could be made in the data program that would allow emphasis to be placed on attaining the goals that have not been met. A streamflow data program based on the guidelines developed in this study is proposed. (Knapp-USGS)

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR MOUNTAIN CREEK, TRINITY RIVER BASIN, TEXAS, 1969,
Geological Survey, Austin, Tex. Water Resources Div.
H. D. Buckner.
Geological Survey Report, January 1971. 9 p, 1 fig.

Descriptors: *Streamflow, *Flow measurement, *Data collections, *Gaging stations, *Reservoir stages, Texas, Surface waters, Hydrologic data, Flow rates, Average flow, Low flow, Peak discharge, Lakes.
Identifiers: *Trinity River basin (Tex), Basic data, Flow extremes.

Streamflow data for 3 gaging stations and reservoir contents for one lake in the Trinity River basin, Texas, are tabulated for the 1969 water year (October 1, 1968 to September 30, 1969). The stations include Mountain Creek near Cedar Hill, Walnut Creek near Mansfield, Mountain Creek at Grand Prairie and Mountain Creek Lake near Grand Prairie. Pertinent information concerning historic and current hydrologic data are included in the table headings. Basin outflow for the 1969 water year was 145,400 acre-feet. Storage in Mountain Creek Lake showed a net increase of 2,850 acre-feet during the water year. Rainfall over the study area for the 1969 water year was about 33 inches, which is about 1 inch below the long-term mean for the area. (Woodard-USGS)

RECORDS OF WATER-LEVEL MEASUREMENTS IN WELLS IN GALVESTON COUNTY, TEXAS, 1894-1969.
Geological Survey, Houston, Tex.

Published and distributed by the Texas Water Development Board, P O Box 13087 Austin, Tex 78711. R. K. Gabrysch, Gene D. McAdoo, and C. W. Bonnet, compilers. Texas Water Development Board Report 123, December 1970. 100 p, 1 fig, 1 tab, 4 ref.

Descriptors: *Water levels, *Groundwater, *Observation wells, *Data collections, Texas, Hydrologic data, Water level fluctuations, Aquifers, Wells, Depth.
Identifiers: *Galveston County (Tex).

Measurements in most observation wells in Galveston County, Texas, are made annually, but some measurements are made monthly, quarterly, or semiannually. A continuous measurement record is obtained at two locations where water-stage recorders are installed. If numerous measurements in a well were made during a short period of time, or if water-level data were obtained from a water-stage recorder, representative water levels were selected for publication. Water levels are referenced to land-surface datum. (Woodard-USGS)

QUALITY OF SURFACE WATERS OF TH UNITED STATES, 1965, PARTS 12-16.
Geological Survey, Washington, D.C.

For sale by Superintendent of Documents, U.S Government Printing Office, Wash, D.C. Price $2.00. Geological Survey Water-Supply Pape 1966; 1970. 462 p, 1 fig, 32 ref.

Descriptors: *Water quality, *Surface water *Data collections, *Water analysis, *Pacifi Northwest U.S., Alaska, Hawaii, Sediment tran port, Sediment yield, Sediment load, Particle size Water temperature, Water properties, Wate chemistry, Chemical analysis.
Identifiers: *Basic data (Surface-water quality).

This volume includes data on quality of surfac waters in Northwestern conterminous Unite States, Alaska, and Hawaii for the 1965 water yea (October 1, 1964 to September 30, 1965). Th Geological Survey maintained 206 stations on 15 streams. Samples were collected daily and monthl at 67 of these locations for chemical-quality stu dies. Samples also were collected less frequently a many other points. Water temperatures were mea sured continuously at 126 and daily at 36 stations Quantities of suspended sediment are reported fo 35 stations from samples collected one or mor times daily. Particle-size distributions of sediment were determined at 41 stations. Descriptive state ments are given for each sampling station includin location of the station, drainage area, periods o records available, extremes of dissolved solids hardness, specific conductance, temperature, sedi ment loads, and other pertinent data. Records o discharge of the streams at or near the samplin station are included in most tables of analyses (Woodard-USGS)

SURFACE WATER SUPPLY OF THE UNITED STATES, 1961-65: PART II. PACIFIC SLOPE BASINS IN CALIFORNIA - VOLUME I.
Geological Survey, Washington, D.C.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Wash, D.C. 20402 - Price $2.75. Geological Survey Water-Supply Paper 1928, 1970. 501 p, 3 fig, 1 plate.

Descriptors: *Surface waters, *Flow measurement *Hydrologic data, *Gaging stations, *California, Data collections, Streamflow, Lakes, Reservoir stages, Runoff, Discharge measurement, Average flow, Low flow, Peak discharge.
Identifiers: *Pacific slope basins (Calif).

This volume which contains hydrologic data of basins from Tia Juana River to Santa Maria River in California, is one of a series of 37 reports presenting records of stage, discharge, and content of streams, lakes, and reservoirs in the United States during the 1961-65 water years. The tables of data include a description of the gaging station, and daily, monthly, and yearly discharges of the stream. The description of the station gives the location drainage area, records available, type and history of gage, average discharge, extremes of discharge, and general remarks. For most gaging stations on lakes and reservoirs, a description of the

tation and a monthly summary table of stage and ontents are given. Data for partial-record stations nclude discharge measurements at low-flow par-ial-record stations, and annual maximum stage and ischarge at crest-stage stations. (Woodard-USGS)

HE STREAMFLOW DATA PROGRAM IN OWA - EVALUATION OF THE PAST, ROPOSAL FOR THE FUTURE,
eological Survey, Iowa City, Iowa.
an L. Burmeister.
eological Survey Open-file Report, 1970. 82 p, 10 g, 8 tab, 15 ref, append.

escriptors: *Streamflow, *Hydrologic data, *Pro-ams, *Project planning, *Iowa, Water resources, rface waters, Gaging stations, Stream gages, ata collections, Discharge measurement, Flow haracteristics, Average flow, Frequency analysis, recipitation (Atmospheric), Runoff, Flow rates, egression analysis, Network design, History, atural flow, Regulated flow, Streams, Tempera-re.
entifiers: *Streamflow data (Iowa).

he streamflow data program in Iowa was evalu-ed on the basis of past records and present goals d needs. Many of the goals could be met by neralization of the data for gaged basins by gression analysis. Estimates of mean annual and onthly discharges, flood-volume and peak scharges of 5-year frequency or greater can be ade within the accuracy equivalent to 10 years of cord. Mean annual and 7-day 50-year flood lume discharges can be estimated within the ac-racy equivalent of 25 years of record. Significant anges could be made in the present data program at would allow emphasis to be placed on attaining e goals that have not been met. Contingent upon tual agreement with cooperating agencies, the wa District proposes discontinuing 33 of the 119 ntinuous-record streamflow stations and ablishing 8. An updated program of data collec-n and analysis is proposed. (Woodard-USGS)

YDROLOGIC REGIMEN OF WALKER LAKE, NERAL COUNTY, NEVADA,
ological Survey, Washington, D.C.
Eugene Rush.
r sale by US Geological Survey, Washington, DC 242-Price $1.00. Geological Survey Hydrologic estigations Atlas HA-415, 1 sheet, 1970. Text, 7 1 tab, 15 ref.

scriptors: *Lake morphology, *Water levels, ater level fluctuations, *Hydrologic data, ydrologic budget, *Nevada, Droughts, cipitation (Atmospheric), Streamflow, Runoff, ter yield, Water quality, Dissolved solids, Water ization, Recreation, Water conservation, aporation, Water balance.
ntifiers: *Walker Lake (Nev), Water budget.

lker Lake is about 60 miles southeast of Carson y, Nev. The town of Hawthorne, Nev., is near south end of the lake. The lake is used prin-ally for boating, water skiing, and fishing. How-r, there is considerable concern for the future of lake because of its rapid stage recession. The al-de of the lake's surface has receded from about 83 feet in 1882 to 3,970 feet in 1968 and the face area has decreased from nearly 69,000 es to 38,000 acres. The maximum depth in 1968 about 118 feet. At the present rate of reces-n, the lake may not reach new equilibrium until lake level recedes another 70 feet, at which e the area might be approximately 25,000 acres and the depth 40 feet. The purpose of this report is (1) to define the area and volume configurations of the lake and (2) to show the effects of recession processes on lake stage, area, volume, and dissolved-solids content. This one-sheet atlas includes a hydrologic regimen map (scale 1:62500) of Walker Lake and eight related tables and illustrations. (Woodard-USGS)
W71-05095

AVERAGE ANNUAL PRECIPITATION AND RUNOFF IN NORTH COASTAL CALIFORNIA,
Geological Survey, Washington, D.C.
S. E. Rantz.
For sale by US Geological Survey, Washington, DC Price 75 cents. Geological Survey Hydrologic Investigations Atlas HA-298, 1968. Text, 1 fig, 4 map, 1 tab, 19 ref.

Descriptors: *Rainfall-runoff relationships, *Hydrologic data, *Maps, *Water resources, *California, Evapotranspiration, Regression analysis, Mathematical studies, Streamflow, Flow rates, Water yield, Runoff, Rainfall, Hydrology, Hydrologic cycle, Vegetation effects, Distribution patterns, Average, Annual, Seasonal, Precipitation (Atmospheric), Drainage systems.
Identifiers: *California (North Coastal), *Hydrologic atlas, Drainage area.

This report consisting of a hydrologic atlas of 4 maps on I sheet and a separate text, presents average annual precipitation, annual precipitation, and runoff in California coastal basins north of San Francisco Bay, and demonstrates a close relation between average annual runoff and average annual precipitation and potential evapotranspiration. Multiple linear regression equations relating these elements are derived for each of the two physiographic sections or subregions in the study area--the Coast Ranges and the Klamath Mountains. The study area includes about 17,000 square miles. The principal streams are the Russian, Eel, Mad, Klamath, and Smith Rivers, all of which drain large interior basins. Most of the other streams in the region drain only the coastal slope of the Coast Ranges. The map showing principal drainage systems and hydrologic units delineates the systems and those units under consideration for project planning. Average annual runoff in the study area totals about 31 million acre-feet, which is the equivalent of about 34 inches of water over the entire area. The long-term basinwide averages range from 7 to 90 inches. (Woodard-USGS)
W71-05096

WATER RESOURCES OF THE WILD RICE RIVER WATERSHED, NORTHWESTERN MINNESOTA,
Geological Survey, Washington, D.C.
T. C. Winter, L. E. Bidwell, and R. W. Maclay.
For sale by US Geological Survey, Washington, DC 20402 - Price $2.00 per set. Geological Survey Hydrologic Investigations Atlas HA-339, 4 sheets, 1970. Text, 25 fig, 18 map, 5 tab, 6 ref.

Descriptors: *Water resources development, *Surface waters, *Groundwater, *Hydrologic data, *Minnesota, Water resources, Surface-groundwater relationships, Precipitation (Atmospheric), Streamflow, Runoff, Hydrogeology, Aquifers, Aquifer characteristics, Water yield, Water quality, Floods, Water utilization, Consumptive use, Water pollution control, Hydrology.
Identifiers: *Wild Rice River basin (Northwestern Minn).

This hydrologic atlas contains 4 sheets (approximately 42x46 inches each) of hydrologic data shown in maps, tables, graphs, and illustrations concerning water resources of the Wild Rice River watershed in Northwestern Minnesota. The annual mean runoff of the entire Wild Rice River watershed is about 1.8 inches or 250,000 acre-feet. Flooding along the lower Wild Rice, Marsh, and Sandhill Rivers is caused by flat land surface, small capacity channels, and low gradient of the channels in the lake plain. The natural streamflow of the Red River of the North is inadequate for a dependable water supply and pollution abatement in the river. Streamflow is supplemented by release of stored water from Orwell Reservoir on the Ottertail River and from Lake Ashtabula on the Sheyenne River in North Dakota. The area with best potential for large yield wells is the outwash and ice-contact sand and gravel in the eastern part of the watershed. Calcium magnesium bicarbonate, the most common water type in the area, occurs mainly in the central and eastern part of the watershed. (Woodard-USGS)
W71-05113

WATER RESOURCES OF THE RED LAKE RIVER WATERSHED, NORTHWESTERN MINNESOTA,
Geological Survey, Washington, D.C.
L. E. Bidwell, T. C. Winter, and R. W. Maclay.
For sale by US Geological Survey, Washington, DC 20402 - Price $2.00 per set. Geological Survey Hydrologic Investigations Atlas HA-346, 4 sheets, 1970. Text, 26 fig, 16 map, 6 tab.

Descriptors: *Water resources development, *Surface waters, *Groundwater, *Hydrologic data, *Minnesota, Streamflow, Runoff, Precipitation (Atmospheric), Hydrogeology, Aquifers, Aquifer characteristics, Water yield, Water quality, Water utilization, Consumptive use, Water resources, Planning, Hydrology, Hydrologic cycle, Floods.
Identifiers: *Red Lake River Basin (Northwestern, Minn).

This hydrologic atlas contains 4 sheets (approximately 42x46 inches each) of hydrologic data shown in maps, tables, graphs, and illustrations concerning water resources of the Red Lake River watershed in Northwestern Minnesota. The hydrologic system within the Red Lake River basin is described and analyzed from a regional viewpoint. It is concluded that any large scale development of water supply within the basin would require additional structural measures to store water either on the land surface or within the groundwater reservoir by using the natural storage capacity of aquifers. The latter alternative would require much more information on the storage capacity of the groundwater reservoir in the particular place of development. Flooding is a major problem within the flat areas of the watershed but measures for considerable control have been completed. In its natural condition the watershed is ideally suited for wildlife propagation throughout much of its eastern part. Potential for water-based recreation is large in the morainal and Upper and Lower Red Lake area. Water supply is a particular problem in the western, highly developed agricultural area of the watershed. (Woodard-USGS)

LABORATORY LOAD TESTS ON BURIED FLEXIBLE PIPE,
Bureau of Reclamation, Denver, Colo. Office of Chief Engineer.
Amster K. Howard.
Available from NTIS as PB-195 773, $3.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation Report No REC-OCE-70-24, June 1970. 72 p, 4 tab, 43 fig, 5 ref.

Descriptors: *Pipelines, Backfill, Soil mechanics, Cohesive soils, Test procedures, Underground structures, Research and development, Laboratory tests, Pressure measuring instruments, *Soil pressure, Pressure sensors, Strain gages, Embankments, Lateral forces, *Steel pipes, Pipes, Strain, Deflection, Deformation, Settlement (Structural).
Identifiers: *Flexible pipes, *Buried pipes, Pressure cells, Loading tests, Iowa Formula, Soil-structure interaction.

In an effort to lower construction costs of closed conduit systems, the Bureau of Reclamation has been investigating the soil-structure interaction of buried flexible pipe. The test pipes are buried in a large container by placing a lean clay soil at optimum moisture around and over the pipe at 90% maximum dry density. Surcharge loads are applied with a universal testing machine. Measurements of soil pressures on the pipe and soil container walls, changing dimensions of the pipe, soil movement around the pipe, and strain on the inner surface of the pipe are made during a 1-day loading sequence. Deflection data from 5 tests reported earlier and 4 additional tests showed good correlation with the Iowa Formula for flexible pipe design. The deformed shape of the pipe ranged from elliptical to rectangular, depending on the ring stiffness of the pipe. One pipe failed by elastic buckling at 8% vertical deflection. Plastic hinges formed in the other pipe between 16 and 22% vertical deflection.

A SYSTEMS STUDY OF SOFT GROUND TUNNELING,
Fenix and Scisson, Inc., Tulsa, Okla; and Little (Arthur D.) Inc., Cambridge, Mass.
C. T. Brandt, R. B. Stone, A. R. Smith, B. H. Willis, and Alex Pastuhof.
Available from NTIS as PB-194 769, $3.00 in paper copy, $0.95 in microfiche. Final Report DOT-FRA-OHS-GT-231, May 1970. 486 p, 3 fig, 15 tab, 266 ref. DOT-FR-9-0034.
Identifiers: *Tunnels, *Subsurface investigations, Subways, Tunneling, Excavation, Underground surveys, Shields, Tunneling, Underground supporting, Tunnel linings, Shotcrete, Reinforced concrete, Soil analysis, Construction equipment, Construction materials, Construction costs, Cost comparison, Systems analysis, *Soft ground tunneling, Advanced planning.

A fundamental investigation of soft-ground tunneling operations was made to identify and assess the potential technical and economic feasibility of new tunneling system concepts. Quantitative estimates were made of costs and rate of advance of different candidate system concepts relative to an assumed set of tunneling conditions. The magnitude of R and D effort required to achieve cost reductions and performance improvements over the 1970 to 1985 time period was estimated. The study concludes that the major restraints to reducing costs and increasing performance in soft ground tunneling over the 1970 to 1985 time period will result from the lack of any effective method for handling bouldery ground and from the lack of a method for rapid installation of the permanent tunnel liner continuously and concurrently with the advance of the face. With a 15-year R and D effort of $35 to $70 million, these problems could be substantially overcome and current tunneling costs could be expected to decrease by 40-65% and advance rates could be expected to increase by a factor of from 4 to 8. Cost differences among the more promising alternative system concepts were found to be small relative to the range of uncertainty associated with the cost forecasts. The most promising areas of new technology were judged to be the dredgehead for excavation; soil-water balance, air-on-face, synthetic resins, and cryogenic freezing for ground control; modular vehicle and hydraulic pipeline for materials handling; and shotcrete and fast setting poured-in-place concrete for tunnel wall support.

OPERATION AND MAINTENANCE MANUAL FOR MISSION HAMMERDRILL.
Mission Mfg. Co., Houston, Tex.

3rd Edition, 1968. 38 p.

Descriptors: *Drilling, *Water wells, *Drilling equipment, Wells.
Identifiers: *Hammerdrill, Percussion drilling, Drilling rate, Drilling operations, Bit weight, Rotation speed, Bit failure, Safety rules, Maintenance.

The Mission Hammerdrill is a pneumatically operated, bottom-hole drill that efficiently combines the percussive action of cable tool drilling with the rotary action of rotary drilling. The Hammerdrill can be used on any standard rotary rig with the necessary air-compressor capacity. It is used for fast and economical drilling of medium-hard formations in quarry, construction, water-well, oil-well, and geophysical work. Fast penetration results from several factors. Because the Hammerdrill is a bottom-hole tool, the piston blows are transmitted directly to the bit without losing percussive energy through the drill string. Thus the air is fully utilized for the rapid impacting action and for blasting and lifting cuttings from the hole. Continuous hole cleaning bares new formation to the bit so that practically no energy is wasted in chewing up cuttings. Straight hole is assured by short, rapid blows that minimize the effect of dipping and broken formation. A straight hole is easier to case and work over, easier to load with explosives or fit with a pump. (Campbell-NWWA)

NOVEL DRILLING TECHNIQUES,
Esso Production Research Co., Houston, Tex.
William C. Maurer.
New York, Pergamon Press, 1968. 114 p.

Descriptors: *Drilling, *Oil industry, Drilling equipment, Rock mechanics, Exploration, Research equipment.
Identifiers: *Rock destruction mechanisms, *Novel drilling techniques, Mechanical drilling, Thermal drilling, Vaporization drilling, Chemical drilling, Drilling performance data, Erosion jet drilling, Turbodrilling, Electric drilling.

Considerable research is going on throughout the world to develop new methods for drilling and excavating rock. In this study novel drills are defined as those which do not use conventional bits to attack rock. Considerable research is being done to develop bottomhole drilling motors such as electric drills and turbodrells. Although the devices described in this study are called novel, many of the concepts involved are quite old, as evidenced by the fact that the first flame drill was patented in 1853 and the first electric arc drill was patented in 1874. What we choose to call novel devices remove rock by four basic mechanisms: mechanically induced stresses, thermally induced stresses, fusion and vaporization, and chemical reactions. These devices have potential applications wherever rock is drilled, crushed, or excavated. Novel rock destruction methods will find initial application where rate of rock removal is more important than unit cost, such as in some military applications. They will also find application where restrictions are imposed on the rock destruction device (such as weight limitation in space exploration or size limitation in deep oil wells). Once novel methods find initial application, they will be refined and improved until their costs are reduced to the point where they find more widespread application in industry. Improvements are continually being made on equipment and techniques, so these new devices must be continually re-evaluated. Because of these continued improvements, some of the new drilling and excavating methods not economical today may find application in a few years. New devices that are exotic today may be conventional tomorrow. (Campbell-NWWA)

WATER WELL DRILLING WITH CABL TOOLS,
Raymond W. Gordon.
Milwaukee, Wisconsin, Bucyrus-Erie Company 1958. 230 p.

Descriptors: *Drilling, *Drill holes, Drilling equipment, Wells, Water supply, Groundwater Sampling, Well screens.
Identifiers: *Cable tool drilling, *Drilling too string, Fishing tool string, Pipe and casing, Drillin problems, Installation of screens, Well develop ment, Mud scow drilling, Bit dressing, We failures, Percussion drilling.

The book admits that there are about as man detailed procedures for drilling a water well wit cable tool equipment as there are drillers, for eac successful driller has developed his own drillin techniques over the years. Since each well differ from every other, an operator must watch develop ments constantly, planning in advance for anythin which might delay operations. For these reasons the material in this book is not set down as a rul but rather as one generally accepted method o handling percussion drills and cable tools. Count less operators have developed drilling and fishin tools to meet their needs. As a result of much in genuity and experimentation, many effective tool are on the market today. Only tools which are i widespread use are discussed. (Campbell-NWWA)

WELL DRILLING OPERATIONS.

Dept Army Technical Manual TM 5-297 and Dep Air Force Manual AFM 85-23, Washington, DC US Government Printing Office, September 1965 249 p.

Descriptors: *Drilling, *Water wells, *Wells, Rotary drilling, Well screens, Pumps, Drawdown, Yield, Logging (Recording), Core drilling, Drilling equipment, Drilling fluids, Potable water, Groundwater.
Identifiers: Driven wells, Dug wells, Jetted wells, Drilled wells, Well construction methods, Percussion drilling, Methods, Well completion, Well development, Suction lift pumps, Deep well pumps, Arctic well development.

The purpose of this manual is to provide instruction and guidance for military personnel engaged in, or responsible for, establishing water sources by the use of wells; providing geological data through the medium of exploratory drilling, core drilling, and sampling; and providing demolition drilling support. It also serves as a basic text for the training of personnel in these areas. This manual covers the military applications of construction techniques for wells of all descriptions to include dug, bored, driven, jetted, and drilled wells. These are the types most likely to be constructed by military personnel in a theater of operations. It describes the use of equipment for developing groundwater sources and for associated uses including exploratory drilling, core drilling and sampling, and demolition drilling support. It discusses the various methods of well construction, related procedures for subsurface soil exploration, and drilling and tunneling for demolition emplacement. Operation of drilling equipment and the latest techniques in drilling for water are described in detail. Use of expedient methods for constructing wells is also described, since they may be required when standard well drilling equipment is not available. Discussed herein also are equipment and aids normally used in civil practice that may be adapted to military use. Multiple wells are discussed and the different types of pipe connections are explained. A chapter describes arctic well construction. (Campbell-NWWA)
W71-05293

AN EXPERIMENTAL STUDY OF INDEXED DULL BIT-TOOTH PENETRATION INTO DRY ROCK UNDER CONFINING PRESSURE,
Rice Univ., Houston, Tex.
P. F. Gmirk, and J. A. Musselman.

Society of Petroleum Engineers of AIME, Preprint No SPE-1712, 1967.17 p.

Descriptors: *Drilling, *Oil industry, Drilling equipment, Rotary drilling, Rock mechanics.
Identifiers: *Dull bit-tooth penetration study, Dry rock, Rock confining pressure, Indexing distance, Bit-tooth force, Optimum indexing distance.

Consideration is given to indexed penetrations by a single dull bit-tooth under statically-applied loads nto rock subjected to confining pressures of atnospheric to 5,000 psi and atmospheric pore pressure. Experimental results obtained with a 45 deg vedge tooth over the above range of pressures are presented for two limestones and a sandstone, a variety of indexing distances, and two degrees of ooth dullness. The optimum distance between successive bit-tooth penetrations required for maxmum rock damage and chip formation decreases ubstantially with increasing confining pressure bove the brittle-to-ductile transition pressure of a articular rock, but remains approximately contant for a variation in confining pressure below the ransition pressure. At a given condining pressure he bit-tooth force required for chip formation is onstant for indexing distances greater than opmum but decreases linearly, in general, with ecreasing indexing distance for distances less than ptimum. The chip-formation force data obtained t confining pressures for which the chip-generaon mechanism is macroscopically of a pseudoslastic nature compares favorably with previous heoretical results for indexed dull bit-tooth enetration into an idealized rigid/perfectly-plastic ock. HE PERFECT-CLEANING THEORY OF ROARY DRILLING,
ersey Production Research Co., Tulsa, Okla.
/. C. Maurer.
ournal of Petroleum Technology, p 1270-1274, ovember 1962. 12 fig, 21 ref.

escriptors: *Rotary drilling, *Oil industry, Drilling, Drilling equipment.
dentifiers: *Perfect-cleaning theory, Crater formaon, Drilling-rate formula, Experimental data, ate-power relationships, Imperfect-cleaning relaonships.

drilling-rate formula for roller-cone bits is erived from rock cratering mechanisms. This forula holds for 'perfect cleaning', which is defined the condition where all of the rock debris is moved between tooth impacts. Under these contions, the drilling rate is directly proportional to e rotary speed and to the bit weight squared, and versely proportional to the bit diameter squared d to the rock strength squared. Under imperfect eaning conditions, such as those usually present field drilling, regrinding of the cuttings occurs der the bit, and the drilling rates fall below those r perfect cleaning. FFORTS TO DEVELOP IMPROVED OILELL DRILLING METHODS,
rsey Production Research Co., Tulsa, Okla.
W. Ledgerwood, Jr.
IME Petroleum Transactions, Vol 219, p 61-74, 60. 25 fig, 23 tab, 73 refs.

escriptors: *Drilling, *Oil industry, Drilling uipment, Rotary drilling.
entifiers: *Novel drilling, Flame drill, Bottom le hydraulic rotary, Electric arc, Chemical illing, Pellet impact drill, Shock-wave drill, Calyx ill, Turbodrill, Rocket exhaust drill, Abrasive-jet ill, Continuous core drilling.

uring the past three decades, the oil industry has pended increasing efforts seeking improved illing tools or systems to reduce drilling costs. e total cost of these efforts is unknown, but it rtainly amounts to tens of millions of dollars. ost of the 'new' systems that past and present investigators have sought to develop actually are old public information. In seeking to implement new-system concepts, investigators have tested the following: impact at frequencies ranging from 6 to 300 cycles per second; electrical, mechanical and hydraulic means of actuating percussors; bit rotary speeds up to 2,000 rpm; electric and hydraulic bottom-hole means of rotating bits; bottom-hole machines with power outputs up to 400 hp; shock waves; explosives; high-belocity pellets; flame; arc; grinding wheels; abrasive jets; erosion by high-velocity gases; chemical attack; electric current; magnetic waves; retractable rock bits; reelable drill pipe; continuous coring with reverse circulation; and automation of drilling rigs. In spite of these efforts to discover new and improved systems, rotary drilling maintains its economic leadership. Undoubtedly, rotary drilling costs will continue to be reduced by rigid application of the best available technology and by development of new rotary technology. In view of the extensive past development programs, however, significant long-range improvement appears to be a research, not a development problem. Research must postulate and prove theories and principles governing various subsurface rock-failure processes pertinent to both rotary and new systems. (Campbell-NWWA)

APPLICATION OF ROTARY DRILLING TO WATER WELLS,
J. P. Miller Artesian Well Co., Brookfield, Ill.
W. A. McEllhiney.
Journal American Water Works Association, p 351-355, March 1960.

Descriptors: *Drilling, *Water wells, *Rotary drilling, Drilling eqiupment, Oil industry, Wisconsin.
Identifiers: *Reverse rotary drilling, Well completions, Gravel wells.

In the water supply and industrial fields, rotary drilling equipment has successfully filled a need. It has reduced costs of test hole work and large-bore, gravel-packed wells. Well work involving conventional rotary drilling of large-bore wells (10-20inches) in deep sandstone has rarely been attempted in Wisconsin (1959). The author feels that rotary equipment deserves a fair trial in deep-sandstone type drilling in place of cable-tool drilling. (Campbell-NWWA)

IN HARD ROCK COUNTRY, PERCUSSION TOOL INCREASES DRILLING RATE, CUT COSTS,
Southern Natural Gas Co., Houston, Tex.
Joe B. Cobb.
World Oil, p 116-120, October 1962. 9 fig, 3 tab.

Descriptors: *Drilling, *Oil industry, Rotary drilling, Drilling equipment.
Identifiers: *Percussion rotary drilling, Operation, Economics, Air rotary drilling, Bits, Maintenance.

Southern Natural Gas Company has successfully used the percussion air drilling method to increase penetration rates four to ten times, and reduce over-all drilling costs as much as $16,000 on wells drilled in the hard rock country of San Juan and Grand Counties, Utah. Other advantages of the percussion air drilling technique follow: (1) Wells may be spudded easily in extremely hard formations, (2) straight hole conditions are maintained more easily because of reduced bit load requirements, (3) fewer drill collars are required, (4) less bit wear in some formations extends bit life, reduces required trips to change bits, and (5) larger cuttings are obtained for geologic analysis. Pneumatic percussion drilling now is becoming fully established as an aid to rotary drilling where air or gas can be used as the circulating medium. Although pressures required for operation of the percussion tool are higher (250-400 psi) than those applied in conventional rotary air drilling, booster compressors usually are available at a well for unloading operations and can be used to supply the higher pressure air needed for percussion tool operation. The extra energy is used to achieve increased chipping action at the bit and a higher penetration rate, and is especially effective in hard or brittle formations. (Campbell-NWWA)

BOTTOM-HOLE PERCUSSION TOOLS-WHERE AND HOW TO USE THEM,
Mission Manufacturing Co., Houston, Tex.
S.C. Berube, and R. N. Young.
Rock Products, p 79-81, October 1966.

Descriptors: *Drilling, *Oil industry, Wells, Drilling equipment.
Identifiers: *Bottom-hole percussion tool, Air volume requirement, Drill pipe size, Torque, Rotation speed, Water injection, Maintenance, Penetration rate.

Bottom hole percussion tools and bits are generally used under conditions where other drilling methods are uneconomical due to slow penetration rates, high bit costs or high rig maintenance costs. Requirements to insure the successful application of the bottom hole percussion drilling method are: (1) Adequate volume of compressed air to efficiently clean the hole, (2) Proper size drill pipe, (3) Sufficient pull down on the drill stem to keep the bit engaged against the rock face to be drilled, (4) Sufficient torque to turn the drill stem when the tool is drilling, (5) An adjustable speed rotary mechanism, (6) A means of tool lubrication, (7) Adequate hoisting capacity to lift the tool and drill pipe from the deepest hole the driller expects to drill, (8) Proper breakout equipment to service the tool, (9) A means of sharpening bits. (Campbell-NWWA)

DRILLING FOR THE MAN ON THE RIG,
Oil and Gas Journal, Tulsa, Okla.
Preston Moore.
Technical Manual Reprint, Oil and Gas Journal, 1966. 72 p.

Descriptors: *Drilling, *Oil industry, *Rotary drilling, Equipment, Drilling fluids, Muds, Cement grouting.
Identifiers: *Drilling control factors, *Drilling fluid selection, Drilling fluid composition, Drilling fluid control, Drilling fluid circulation, Hole conditions, Rotary drilling hydraulics, Hole problems, Primary cementing mechanics, Air and gas drilling, Minimum-cost drilling.

The men on the rig spell the difference between economic success and failure in drilling operations. The best technology is useless if it is not applied on the rig daily. This manual is an effort to improve drilling operations. This series of articles incorporates the latest in technology for use by the man in the field. The first step in planning a new well should be a review of all the available information on past wells in the area. This information should be evaluated to determine practices that should and should not be used in the proposed well. This means that second guessing is an accepted as well as a necessary practice. Information, from the bit to use to the best cementing procedures, can save considerable drilling time and trouble. (Campbell-NWWA)

NEWS TOOLS AND PROCEDURES FOR BETTER DRILLING OPERATIONS,
Oil and Gas Journal, Tulsa, Okla.
H. G. Bentson.
Technical Manual Reprint, Oil and Gas Journal, 1964. 56 p.

Descriptors: *Drilling, *Oil industry, *Rotary drilling, Equipment, Drilling fluids, Mud.
Identifiers: *Rock-bit design, *Rock-bit selection, Rock-bit evaluation, Cyclone samplers, Drilling

rates, Turbodrill, Turbodrill bit, Formation compressive strength, Surfactants, Rotary speed, Bit weight, Air drilling, Mud drilling.

This booklet describes in considerable detail the various aspects of rock-bit design, selection and evaluation. In addition, rotary drilling rate is examined. Variables affecting rotary-drilling penetration rate are exceedingly numerous. Some of the more recognizable are the effects of drilling-fluid properties, hydrostatic pressure, hydraulic factors, rotary speed, and weight on bit. Also involved are personnel-rig efficiency, straight-hole requirements, and the extreme variance of rock properties and other subsurface conditions in different areas. The various features of the turbodrill is discusses with emphasis on the present lack of adequate bit design features and supporting mud pump capacities. (Campbell-NWWA)
W71-05316

HOW TO COMBAT LOST CIRCULATION,
Oil and Gas Journal, Tulsa, Okla.
J. U. Messenger, J. W. Murray, J. Kelly, Jr., J. R. Eckel, and R. A. Bobo.
Technical Manual Reprint, Oil and Gas Journal, 1969. 50 p.

Descriptors: *Drilling, *Oil industry, Equipment, Drilling fluids, Mud, Rotary drilling.
Identifiers: *Lost circulation, Mud hydraulics, Drilling rate, Problem shales, Parasite tubing string.

Lost circulation is the most troublesome and costly problem in drilling. While no functionally new lost-circulation materials or techniques have been developed in the past 10 years, progress has been made by using existing techniques and materials more effectively. The purpose of this series of articles is to outline these more effective procedures of lost-circulation prevention and control. The different types of loss zones are classified on the basis of severity. Then the different materials and techniques are matched to type and severity of the zone they most likely can cure. Attention is given to methods of preventing lost circulation, and a list is given of the most usual causes of failure to control lost circulation. (Campbell-NWWA)

NEW EQUIPMENT AND OPTIMUM DRILLING TECHNIQUES MAKE FOR BETTER DRILLING PRACTICES,
Oil and Gas Journal, Tulsa, Okla.
E. M. Galle, H. B. Woods, W. R. Greene, L. C. Rogers, and H. M. Rollins.
Technical Manual Reprint, Oil and Gas Journal, 1967. 69 p.

Descriptors: *Drilling, *Oil industry, *Rotary drilling, Equipment, Drilling fluid, Mud.
Identifiers: Constant bit weight, Constant rotary speed, Packer terminology, Tool joints, Drill pipe, Drill collars, Electric drive rig, Rig design.

For each particular drilling situation and rig, there is some 'best' combination of bit weight and rotary speed. If this weight and speed are held constant throughout the bit run, they produce the lowest possible cost. No other combination of speed and weight held constant will be so efficient. This booklet lays out in cook-book fashion a method of the figuring the best constant bit weight and rotary speed. Other topics covered include: Packer terminology and recommended standardization, ways of assuring money's worth from tool joints and drill pipe, ways of avoiding drill collar damage, and new ideas on electric drive rigs. (Campbell-NWWA)

HOW TO SELECT THE CORRECT SAND CONTROL SYSTEM FOR YOUR WELL,
Dow Chemical Co., Los Angeles, Calif. Dowell Div.
A. W. Coulter, and D. G. Gurley.
Society of Petroleum Engineers of AIME, Preprint No SPE-3177, 1971. 6 p, 10 ref.

Descriptors: *Screens, *Permeability, Oil industry, *Water wells, Drilling.
Identifiers: *Sand control system, *Water well completion, Gravel packs, Resin sand consolidation, Resin-coated gravel packs.

There has long been a need for a guide to the selection of the sand control system needed for a particular well. There are four types of systems in use today: (1) screens, (2) gravel packing, (3) sand consolidation and (4) a resin-coated particulate such as sand. Although universal agreement may not be possible at this time, there are certain guidelines that are followed. The factors involved include formation permeability, clay and silt content of formation, interval length, number of zones, homogeneity, well history, type completion, depth, expense of right time and others. This paper will consider these factors and their influence on the selection of sand control systems. (Campbell-NWWA)

HOLE CLEANING,
Shell Development Co., Houston, Tex.
E. A. Hopkin.
Society of Petroleum Engineers of A.I.M.E., Preprint No SPE-1697, 1967. 12 p.

Descriptors: *Drilling fluids, *Drilling, Rotary drilling, Drilling equipment, Muds, Oil industry.
Identifiers: *Drilling rate, *Theory of particle settling, Viscosity effect, Mud density effect, Drill-pipe rotation effect, Cuttings removal rate, Hole enlargement, Stuck drill pipe.

Laboratory tests conducted by Shell Canada, Ltd. together with actual field experience have indicated the magnitude of some of the factors affecting the ability of the drilling mud to clean the hole. A correlation was observed between funnel viscosity and particle slip velocity. A relationship was also observed between the Bingham yield value of the mud and the particle slip velocity. No change is slip velocity was observed with funnel viscosities up to about 80 sec/qt. or to yield values of about 15 lb/100 sq ft. The slip velocity of the particles studied varied from 120 ft/min. with water to close to 0 ft/min. for high mud viscosities. Increasing the mud density, creating laminar annular mud flow or rotating the drill pipe appeared to improve the carrying capacity. Field tests indicated that during fast upper-hole drilling, the rate of cutting removal must be sufficient to maintain the concentration of cuttings in the annulus at less than 5 per cent by volume to prevent balled-up drill collars and stuck drill pipe. (Campbell-NWWA)

THE STRAIGHT HOLE TURBODRILL,
Eastman Oil Well Survey Co., Tulsa, Okla.
David B. Shulz.
Society of Petroleum Engineers of A.I.M.E., Preprint No SPE-3230, 1971. 8 p, 8 fig, 4 tab.

Descriptors: *Drilling, *Drilling equipment, Rotary drilling, Oil industry, Core drilling.
Identifiers: *Turbodrilling, Directional turbodrilling, Straight-hole turbodrilling, Turbodrill application, Turbodrill diamond bits, Horsepower requirements.

From the first patent of a turbodrill in 1884, a span of 70 years of development and improvement was necessary before the beginning of its use as a directional drilling tool. Improvements in directional turbodrills led to the marketing of the straight-hole turbodrill and its use in problem areas of vertical wells and directional wells. Diamond bits used with turbodrills must be built with large water courses and low pressure drop across the face. Cleaning and cooling is accomplished by changes in the flow characteristics of the fluid as the rotating speed of the bit is increased. Horsepower output of a turbodrill is affected by changes in the number of turbine stages in flow rate and in volume of fluid. A summary of drilling records show some applications of the turbodrill. Greater drilling depths of the future will present more problem and more applications of all down-hole motor (Campbell-NWWA)

WATER HAMMER AND SURGE TANKS,
G. V. Aronovich, N. A. Kartvelishvili, and Ya. K. Lyubimtsev.
Available from NTIS as TT70-50025, $3.00 in paper copy, $0.95 in microfiche. Trans. of Gidravlicheskii Udar i Uravnitelnye Rezeruary Moscow, 1968. Israel Program for Scientific Translations, 1970. 209 p. Jerusalem, 1970. 203 p.
Identifiers: *Water hammer, *Hydraulic equipment, *Surge tanks, Performance, Unsteady flow, Pipes (Tubes), Theory, Oscillations, Stability, Translations, USSR.

The book considers unsteady motion of liquids in hydraulic pressure systems (hydroelectric power stations, water and petroleum conduits, pressure irrigation systems, hydraulic fuel supply systems, etc.). The general theory of water hammer is presented for simple conduits and complex piping systems. Probability problems of water hammer related to the probability nature of laws governing valve closure are considered, as well as the relationship between these problems and conduit reliability. Surge-tank operation is considered from the following points of view: (1) as a means of damping out water hammer; (2) as a device having a substantial effect on the stability of steady hydraulic regimes; (3) as device whose overall dimensions must be established by hydraulic calculations. The relationship between water hammer and fluctuations of the liquid masses in the surge tanks is analyzed.

PRACTICAL RESERVOIR ENGINEERING,
Tulsa Univ., Okla.
E. T. Guerrero.
Tulsa, Oklahoma, Petroleum Publishing Company, 1968. 266 p.

Descriptors: *Oil industry, *Hydraulics, *Aquifers, *Groundwater, Design, Porosity, Permeability, Rock properties, Logging (Recording), Electric log, Unsteady flow.
Identifiers: Effective porosity determination, Washburn-Bunting porosimeter, Microlog, Microlaterlog, Neutron-Derived porosity curve, Absolute permeability, Effective permeability, Productivity index, Steady-state relative-permeability measurements, Interstitial-water saturation determinations, Smith equation, Curtis and Brinkley method.

The practical methods of the petroleum industry for reservoir engineering are presented in 102 parts. Practical applications are emphasized and enough theoretical concepts and references are included to give interested readers the fundamentals of the methods used by the petroleum industry. This book demonstrates most of the practices and concepts used by the industry which overlap similar practices used in the groundwater industry. Significant semantic differences exist but considerable advances have been made which should have spin-off value for use in groundwater engineering, especially as deeper groundwater is sought in the future and increased pressures, temperatures, etc., are encountered. The text is well-illustrated and well-referenced and should be of interest to workers involved in groundwater reservoir studies. (Campbell-NWWA)
W71-05290

BAROID DRILLING MUD DATA BOOK.
National Lead Co., Houston, Tex. Baroid Div.

Houston, Texas, National Lead Company, Baroid Division, 1954. 471 p.

Descriptors: *Drilling fluids, *Drilling, *Oil industry, Emulsions, Foaming, Mud, Wells, Expansive clays, Bentonite.
Identifiers: Drilling mud properties, Chemical treatment, Oil muds, Basic mud mixing, Drilling mud costs, Mud field tests, Drilling mud problems, Lost circulation, Drilling mud engineering, Aquagel, Impermex, Baroco, Zeogel, Anhydrox, Emulsion mud.

This reference is a complete text on drilling fluid theory and application despite its commercial intent. The following topics are discussed in detail; History, function and types of drilling mud, clays, weighing material, chemical treatments, oil mud use, basic mud mixing techniques, cost appraisals, field testing, trouble shooting, lost circulation problems and their solution. The text is well illustrated and referenced and has been updated since its publication in 1954. An extensive glossary is also included. The text constitutes 14 sections, each being self-contained. (Campbell-NWWA)

PETROLEUM ENGINEERING, DRILLING AND WELL COMPLETIONS,
Texas Univ., Austin.
Carl Gatlin.
Englewood Cliffs, New Jersey, Prentice-Hall Inc., 1960. 341 p.

Descriptors: *Drilling, *Oil industry, *Rotary drilling, Drilling equipment, Sampling, Drilling fluids, Logging (Recording), Cementing, Casing.
Identifiers: *Well completion, Drill stem testing, Formation damage, Core analysis, Penetration rate, Rotary drilling hydraulics, Cable tool drilling, Rock properties.

The book presents an integrated picture of oil well drilling and well completion operations as they are normally encountered by the petroleum engineer. In order to do this without assuming prior knowledge in the field, a number of rather general topics have been included. The chapters on reservoir fluid properties, reservoir rock properties, exploration and leasing practices, core analysis, well logging and formation damage fall into this category. The emphasis is on the specific problem rather than an over-all implications. Petroleum engineering curricula vary widely as to the level at which the drilling course is taught. By including the necessary background material, this text could be considered a first course. It is well illustrated and contains adequate references. (Campbell-NWWA)

Like most other phases of the petroleum industry, the technology, techniques and products used in drilling fluids changed significantly during the middle 1960's. This booklet is an attempt to update previous work on drilling mud developments and techniques. Improvements in drilling rates using new mud techniques have been realized. Hole stability techniques have also been improved as have techniques of solids control, downhole mud temperature stability and corrosion. This booklet is very well illustrated. New experimental studies are discussed. (Campbell-NWWA)

EFFECT OF MUD COLUMN PRESSURE ON DRILLING RATES,
Imperial Oil Ltd., Calgary (Alberta).
A. S. Murray, and R. A. Cunningham.
AIME, Petroleum Transactions, p 46-54, 1956. 11 fig, 10 ref.

Descriptors: *Drilling fluids, *Mud, *Drilling, *Oil industry, Rotary drilling.
Identifiers: *Drilling rate, *Drillability, Confining pressure, Bit load, Drag bit.

If a dense fluid such as mud or water is used for circulation, the formation drilled is influenced by a hydrostatic pressure. This pressure depends on hole depth and drilling fluid density. Laboratory tests indicate that drilling rates in many formations are decreased with increased pressure - in some cases as much as 90 per cent. A comparison between laboratory and field tests indicate that drilling fluid head affects drilling rates in the field approximately the same as in the laboratory. Drilling rates of many formations are increased by reducing drilling fluid head. (Campbell-NWWA)

THERMOELECTRIC GENERATORS POWERED BY THERMAL WASTE FROM ELECTRIC POWER PLANTS,
Federal Water Quality Administration, Corvallis, Oreg. Pacific Northwest, Water Lab.
M. A. Shirazi.
Federal Water Quality Administration, Water Pollution Control Research series 16130, September, 1970 presented at the IECEC Energy 70 Conference, Las Vegas, Nevada, Sept, 1970, p 27. 5 fig, 5 tab, 6 ref.

Descriptors: *Thermal pollution, *Electric powerplants, Heat exchangers, Condensers, Costs, Heat transfer, Temperature, Cooling water, Water pollution control, *Thermal powerplants.
Identifiers: *Thermoelectric generators, Thermal waste, Turbine back pressure, Power density, Power intensity.

A crossflow type heat exchanger with the plate fin surface geometry is described. The plate separating the hot fluid from the cold fluid contains the thermoelectric unit. Equations for calculating convective heat transfer coefficients, the friction power extended per unit surface area and the maximum conversion efficiency are described. The alloys considered in this study were Bi2Te3 - Bi2Se3 (n type) and Bi2Te3 - Sb2Te3 (p type). While conducting the latent heat from the condensing steam to the cooling water, the couples convert a portion of this heat to electricity. A second source of waste heat in a conventional fossil-fueled electric powerplant is the hot stack gases released into the atmosphere. Another source is hot exhaust gases from a gas turbine electric power system. Condenser performance data are presented in three separate tables. Power generated increases with turbine back pressure. A capital cost estimate for three plate module thickness of 0.01, 0.02 and 0.05 inch are estimated at $1250, $1560 and $3720 per kw, respectively. Ratio of the cost of thermoelectric to stream electric generation increased with plate thickness and is as high as 14 for a plate thickness of 0.05 inch. It is uneconomical, at the present time, to use thermoelectric devices to generate electricity from waste heat. (Upadhyaya-Vanderbilt)

WATER TRANSPORT OF THE ODD-SHAPED HEAVY RUNNERS OF LARGE FRANCIS HYDRAULIC TURBINES,
Bureau of Reclamation, Denver, Colo.
M. I. Galperin, and A. V. Chekulaev.
Available from NTIS as PB-193 593, $3.00 in paper copy, $0.95 in microfiche. Translated from Energomashinostroenie No 2, p 45, 1966. Bureau of Reclamation Translation No 674, Sept 1966. 7 p, 2 fig, 1 ref.

Descriptors: Turbine parts, *Turbine runners, Hydraulic turbines, *Francis turbines, Foreign projects, Handling equipment, *Transportation, Hoisting machinery, *Waterways, Sandbars, Rivers, Boats, Weather, Loads, Ports, Locks, Barges.
Identifiers: Krasnoiarsk Powerplant (USSR), North Sea-Baltic Wtrwy (USSR), Enisei River (USSR), Leningrad Metalworks (USSR).

During the summer of 1965 the first two runners for the Krasnoiarsk 508-mw turbines were successfully transported from the Leningrad Metalworks (LMZ) pier to the construction site of the hydrocomplex on the Enisei River in Siberia. The runners were loaded one at a time at the LMZ pier from railroad transport flatcars to a lighter. At the Leningrad Commercial Seaport they were unloaded by the harbor facilities and then reloaded together with two generator thrust bearing tanks into the hold of a single sea-going barge. The route was through the White Sea-Baltic Seaway, containing numerous, relatively small, one- or two-chambered locks, where the help of tugs and warping hawsers was needed to lock the barge. Through the Northern Seaway along the coast of the Arctic

Ocean, fogs, icepacks, and stormy weather were encountered, but the method of loading and lashing the runners proved to be satisfactory. The Enisei River has many rapids and sandbars from its mouth to the unloading point at Divnogorsk. These required the help of special local tugs and a river pilot. Docking and unloading the runners each required less than 24 hours to accomplish. Success in handling these loads confirms the possibility of handling and transporting the runners for the Aswan High Dam turbines to the UAR in the same way.

SYSTEMS OF HYDRAULIC AUTOMATIC CONTROL IN IRRIGATION CANALS,
Bureau of Reclamation, Denver, Colo.
I. B. Khamadov, F. Ya. Eingorn, and L. A. Om.
Available from NTIS as PB-193 649T, $3.00 in paper copy, $0.95 in microfiche. Translated from: Gidrotekhnika i Melioratsiya No 3, p 36-48, 1967. Bureau of Reclamation Translation No 723, Jan 1968. 35 p, 6 fig, 12 ref.
Identifiers: *Irrigation systems, Automation, *Hydraulic systems, Design, Control systems, Costs, Operation, USSR, Translations, Water use, Irrigation canals.

Several institutions in the Central Asian republics of the USSR have cooperated to develop an automated system of hydraulic controls for irriagation canals. After studying foreign and domestic systems of upstream and downstream controls of all types, they devised a mixed-control system, actuated by direct and reflected hydraulic surges in the canal. This system combines the advantages and features of both upstream and downstream hydraulic controls without a number of their separate disadvantages, but requires canal bottom slopes of less than 0.0003 and costs 9 to 22% more to build than a system with just upstream control. However, the mixed control system is easier, more flexible, and more reliable in operation.

BEST CONSTANT WEIGHT AND POTARY SPEED FOR ROTARY ROCK BITS,
Hughes Tool Co., Houston, Tex.
E. M. Galle, and H. B. Woods.
Reprint: Presented at the Spring Meeting of the Pacific Coast District Division of Production, American Petroleum Institute, Los Angeles, May 1963. 37 p.

Descriptors: *Drilling, *Oil industry, Drilling equipment, *Rotary drilling, Rock excavation, Rock mechanics, Drill holes, Drilling fluid.
Identifiers: *Mathematical analysis, Drilling rates, Optimum rotary speed, Optimum constant weight, Drilling cost, Teeth condition, Bearing life, Formation characteristics.

This is a study of the best constant weight and rotary speed for lowest drilling cost for rolling cutter rock bits. Graphs and charts for a variety of formations are presented for field application. The results of several field test are as follows: (1) mathematical relations have been developed for determining the best constant weight and rotary speed for lowest drilling cost, (2) graphs and procedures have been developed to determine: (a) the best combination of constant weight and rotary speed, (b) the best constant weight for any given rotary speed, (c) the best constant rotary speed for any given weight, (3) in each graphical procedure of the above, drilling cost, footage, drilling time and condition of teeth and bearings of the dull bit may be calculated. (4) Field tests have demonstrated that drilling costs may be reduced by using the weight and rotary speed combinations recommended in this study. (Campbell-NWWA)

ROTARY DRILLING BITS.
Hughes Tool Co., Houston, Tex.
Houston, Texas, Hughes Tool Company, 1966. 37 p.

Descriptors: *Drilling, *Oil industry, *Water wells, Wells, Drilling eqiupment, Drilling fluids, Rotary drilling.
Identifiers: *Rotary drilling bit design, Rock drillability, Bit types and usage, Circulating media, Dull bits, Drilling records.

The introduction of the rolling conical cutter bit greatly increased the economic feasibility of drilling hard formations and led to the general acceptance of the rotary method of drilling oil and water wells. Most types of rock bits will make fair progress in the majority of formations. However, to obtain maximum footage with lower drilling costs, the type of bit should be designed for the specific type of formation being drilled. Various types of bits, several different broad classifications of formations and the types of rock bits best suited to drill them is examined. Examination of dull bits can often furnish information that will assist the selection of bit types and help to determine operating practices. Other topics such as (1) importance of bit records, (2) importance of using proper drilling muds with bits, and (3) selection and operation of rolling cutter bits are discussed. Excellent illustrations are included. (Campbell-NWWA)

KNOW YOUR MUD PUMP,
Mission Mfg. Co., Houston, Tex.
S. L. Collier, W. E. Liljestrand, C. V. Aalaund, N. B. Heaps, and C. P. Reid.
1965. 64 p.

Descriptors: *Drilling fluids, *Pumps, Centrifugal pumps, Hydraulic systems.
Identifiers: *Mud pump research, Normal pump behavior, Friction losses, Suction dampeners, Pressure requirements, Hydraulic knocking, Mechanical knocking, Discharge pressure system, Volumetric efficiency, Reciprocating mud pumps.

Drilling costs can be reduced through a better understanding of the mud pump and accessory equipment. The preliminary results of controlled laboratory tests made with modern instrumentation will aid in acquiring a better knowledge of pump operation. The mud pump is the main element of the surface mud system, but it is only a link in the three element chain consisting of the suction system, the mud pump itself and the discharge system. The actual requirements of the suction system must be understood in order to establish the correct operating conditions for the mud at the pump suction flange. To know what is required of the suction system, both the normal and abnormal situations that occur during, and as a result of, the suction stroke of the piston must be understood. In the discharge stroke, the piston's pattern of motion is molded into a completely different pattern by the complexity of the discharge system. Each element of the system should be operated for the maximum effectiveness by controlling the problems of each through the best use of the piping and the mud reserve, or when necessary, the proper use of the auxiliary equipment. (Campbell-NWWA)

BIT TIPS,
Hughes Tool Co., Houston, Tex.
M. A. Foreman, R. J. Schneider, J. H. Cook, W. J. Highbarger, and T. B. Smith.
Vol 2, 1970. 33 p.

Descriptors: *Drilling, *Oil industry, *Water wells, Wells, Drilling equipment, Drilling fluids, Rotary drilling, Logging (Recording).
Identifiers: *Bit design, *Bit stabilization, Jet nozzles, Bit selection, Bit bearings, Super bit, Well planning, Bit weight, Rotary speed, Formation characteristics, Well logs.

In designing rock bits, space is the controlling factor because the sizes of the parts are determined by the size of the hole to be drilled. Proper selection the right proportions for the various parts, such tooth size, cone shell thickness, and bearing size required. It is known that rock bits perform b when rotating about their own axis. Bearing li because of reduced thrust loading, is also extend when the bit rotates about its own center - es cially under maximum loading. The advent of bits was major breakthrough in obtaining grea penetration rates. Properly directed jet strea combined with correct nozzle sizes clean the cor of the bit and provide efficient removal of cuttin from bottom. Other topics such as bit stabilizati well logs and bit selection, and optimum bit weig and rotary speed are also discussed. (Campbe NWWA)

FLOW THROUGH A TAILINGS POND EM BANKMENT,
Bureau of Mines, Spokane, Wash., and Idaho Univ., Moscow.
C. Dan, aKealy, and Roy E. Williams.
Water Resources Research, Vol 7, No 1, p 143 154, February 1971. 12 p, 9 fig, 2 tab, 15 ref.

Descriptors: *Earth dams, *Seepage, *Under seepage, *Mine wastes, *Laplaces equation, Dam failure, Earthworks, Ponding, Dam design, Flow Porous media, Water levels, Drainage, Leakage Hazards, Model studies, Hydraulic models, Mathematical models, Computer models.
Identifiers: *Tailings ponds.

Mathematical models that solve the Laplace or Richards' equation numerically are used to locate the phreatic surface within a mine tailings pond embankment and to define the subsurface flow system that transports water outward from the pond. Input data needed for the finite element model include the saturated hydraulic conductivity distribution within and beneath the embankment, the fluid potential values at both upgradient and downgradient boundaries of the embankment, and the geometry and elevation of an approximately impermeable layer at some depth beneath the surface of the embankment. This technique was applied to a tailing disposal system in northern Washington. Laboratory tests were used to obtain permeability values. Pond boundaries were examined by drillholes and piezometers. Piezometers were also used to validate the configuration of the

hreatic surface predicted by the model. Of par-
cular importance to slope stability analysis is the
ct that both the model and the check piezometers
dicate that a significant portion of the phreatic
rface within the embankment is concave upward.
xperimentation with the finite element model
evealed that the concave upward portion is a con-
equence of the upstream boundary in a tailings
nd being a flow line and embankment permea-
lity being lower near the upstream boundary; the
ostream boundary of the flow region in an earth
m is normally an equipotential line. (Knapp-
SGS)

mma Ray logging, Gamma-Gamma logging,
utron logging, Velocity logging, Matrix velocity.

e measurement of some of the physical proper-
s of the soils and rocks penetrated by bore holes
vides information of value to the soil engineer.
ctrical resistivity, radiation, and acoustical pro-
rties are particularly useful. The measurements
ntinuously recorded in terms of depths give a
ailed log on which geological and physical
anges are indicated. In a typical case, the field
erations are conducted as follows: (1) A small
mber of test wells scattered over the area of in-
est are drilled, cored, and logged with one or
veral appropriate probes; (2) additional holes are
n drilled between the test wells; and (3) these
es are logged but not cored. By correlating the
s and the core data the geology of the area and
ne of the rock properties can be mapped. None
the methods reviewed, however, can be used to
asure dynamic properties. The main advantages
geophysical logs are that detailed information is
dily obtained at the well sites and at a lower cost
n if each hole were cored. The equipment used
the logging of shallow holes is small, light,
ged and simple. No special technician is needed
its operation. (Campbell-NWWA)

ANNOTATED TABLES OF STRENGTH AND ELASTIC PROPERTIES OF ROCKS,
Illinois Univ., Urbana.
Rudolph G. Wuerker.
AIME, Petroleum Transactions Report No 6, p 23-45, 1969. 7 fig, 5 tab, 75 ref.

Descriptors: *Rock mechanics, *Drilling, *Mining, Physical properties, Oil industry, Sandstone, Limestone, Granite, Marble, Rocks, Strength, Mohr envelop.
Identifiers: *Drillability, *Grindability, *Blastability, U.S. Bureau of Mines, U.S. Bureau of Reclamation, Mhr's hardness scale, Load influence, Temperature factor, Time factor.

Testing for strength and elastic properties of rocks has made rapid progress since the end of World War II. The perfection of standard methods and the awakening interest of all branches of the mineral industry resulted in the collection of a great amount of new physical data on the most common rocks. Interpretation and correlation with technological properties, such as grindability, drillability, and blastability, however, have not kept pace. One of the reasons for this may be the fact that test results on strength and elastic properties are widely scattered in the technical literature. The purpose of this paper is to tabulate the results from such standardized tests and to discuss the importance of each property and its usefulness to the mineral engineer as reflected in the existing literature. Twenty-one rock properties are listed in tables, which have been encountered in mining and petroleum exploration. Not all twenty-one properties have been measured as yet from any one rock but an attempt is made to make the various results match as well as possible. The report is exceptionally well referenced. (Campbell-NWWA)

A NEW APPROACH TO INTERPRETING ROCK DRILLABILITY,
Petroleum Publishing Co., Tulsa, Okla.
M. Grant Bingham.
Technical Manual Reprint, Oil and Gas Journal, 1965. 93 p.

Descriptors: *Drilling, *Oil industry, *Rotary drilling, Equipment, Drilling fluids, Muds, Rock mechanics, Rock properties.
Identifiers: *Rock drillability, *Drilling performance interpretation, Bit design, Bit performance, Performance line, Rotary speed, Laboratory drilling.

Rotary drilling is an anachronism. It stands as the last remaining art in an industry where virtually all other operations have been reduced to a science. A single link remains to be forged before drilling also can elevate itself to scientific status. That vital link is a thorough understanding of what happens on the bottom of the hole as the bit rolls over it. This plan of action measures only a few square inches, but it is the location of the only 'useful' work performed in drilling. This manual relates rotary drilling to rock strength, or rock drillability. The aim of establishing such a relation is to allow prediction of the behavior of a drill bit from one well to the next. To accomplish this objective mathematical equations must be derived which describe the interaction of bit and rock. The author firmly believes that equations can be written to describe and predict drilling in the field. More than 26 variables have been identified which influence drilling. Without understanding their effects, maximum drilling efficiency and minimum costs can never be reached. (Campbell, NWWA)

Identifiers: USSR, Ingursk Dam (USSR), *Exothermic process, Foreign research, Cement efficiencies.

The 4 million cu m of concrete for the 270-m-high Ingursk arch dam, being built in the Caucasus Mountains of the Georgian SSR, must meet very high standards as to deformation and strength (180-day strength of 35 kg/sq cm in tension and 400 in compression). Since none of the plants nearby produced cement of the required quality, especially for low-heat evolution, a program was initiated to develop a cement that would produce concrete of the required quality. Starting with the cements nearest to meeting the requirements, a special Ingursk hydrotechnical cement was developed by substitution of diatomite for a part of the clay component of the clinker, recalcination of the clinker, vibromilling after regular milling, and addition of fly ash. Tests showed that this cement with a coefficient of saturation of 0.84 could be classed as a low-heat cement and that it produced concrete with a compressive strength of 500 kg/sq cm. It was recommended for use in the Ingursk Dam.

ASHALT DIAPHRAGMS FOR DAMS BUILT OF LOCAL MATERIALS,
Bureau of Reclamation, Denver, Colo.
S. N. Popchenko.
Available from NTIS as PB-193 663, $3.00 in paper copy, $0.95 in microfiche. Translated from: Gidrotekhnichesko Stroitel'stvo No 11, p 15-18,

1969. Bureau of Reclamation Translation No 835, March 1970. 11 p, 4 fig, 22 ref.
Identifiers: *Dams, *Bituminous coatings, *Diaphragms (Mechanics), Dams, Reviews, Leakage (Fluid), Control systems, Inland waterways, Construction, Plastics, Mobility, USSR, Seepage shielding materials, Translations.

Vertical, centrally located asphalt diaphragms in dams of local materials are more advantageous in the northern and high elevation regions: they cut down the volume of imported materials and render the work independent of the season. The success of asphalt diaphragms abroad recommends them for the Soviet Union. Their construction can be simplified by the use of poured asphalt-concrete, and they can be made more reliable by placing an asphalt layer along the axis of the diaphragm with the application of repair-electric heating.

CORROSION AND ITS CONTROL,
Oil and Gas Journal, Tulsa, Okla.
Marshall E. Parker.
Tulsa, Oklahoma, Oil and Gas Journal, 1960. 52 p.

Descriptors: *Corrosion, *Cathodic protection, *Oil industry, Damages, Electroysis, Oxidation, Rusting, Water pollution effects, Well casings, Well screens, Corrosion control, Anodes, Cathodes, Waterproofing.
Identifiers: *Corrosion hot spots, *Cathodic protection principles, Pipe-to-soil potentials, Attenuation curves, Magnesium anodes, Corrosion records, Protective metallic coatings, Corrosion of wells, Weld decay.

The subject of corrosion is a matter of prime concern to people engaged in plant and field operations dealing in the recovery and ultilization of liquid products from oil to ground water, including toxic chemicals. There are a number of anti-corrosion methods available, and there are thousands of individual details which make up the literature and techniques on this subject. Some of these methods are more appropriate under specific conditions than others. Great care is recommended for the selection of the means to be used in a given situation. Once the selection is made, careful attention must be paid to proper application of the method. This operating manual gives, in a series of easy-to-read, one page installments, a large variety of technical information, and helpful pointers in the field of corrosion. (Campbell-NWWA)

WATER WELL INCREASING COSTS OF INSTALLATION AND MAINTENANCE,
Layne Texas Co., Houston, Tex.
F. Dorr, Jr., and A. L. Williams, Jr.
Layne Deep Waters, Vol 3, No 2, p 2-5, June 1968. 8 fig.

Descriptors: *Water wells, *Installation costs, *Corrosion, Initial costs, Equipment, Cathodic protection, Electrolysis, Well screens, Casing.
Identifiers: *Corrosion control theory, *Water system corrosion control, Galvanic corrosion.

The increasing cost of materials and labor has proportionally influenced the cost of water wells. Therefore, extending the service life of a water well has become an increasing factor in the sale of new wells as well as the work-over of existing wells. In an investigation by the Layne Texas Company, the corrosion attack on wells was found to be perhaps the most significant factor of a well's failure. The investigation determined that the corrosion could be mitigated or completely stopped through the application of specifically designed materials. The corrosion of the buried metals of a well is related to the flow of direct electrical current from the metal into the adjacent soil or water. The current flow causes a chemical change in the metal, and results in particles of metal being carried away....corrosion. Preventative measures are discussed. (Campbell-NWWA)

Identifiers: *Hydraulic fracturing, *Explosive research, *Rock-blasting mechanism, Explosive research center, Down hole camera.

Small-scale surface tests were conducted to determine the feasibility of using a nitroglycerin base explosive for rock fracture expansion. Preliminary underground testing, surface and near-surface tests with liquid explosives showed that explosives in sheet-like layers simulating underground fracture would detonate and propagate through the layer. The successful surface tests used layers of explosive confined between glass plates and explosive-saturated sand confined in small diameter metal tube. In addition, it was shown that explosion propagated through the pores of Berea sandstone saturated with a liquid explosive. Encouraging results were produced by a shallow test in which extensive fracturing was effected by the detonation of 5 3/4 qt of NGl (nitroglycerin) in a vertical crack 5 ft long, 5 ft deep, and 0.1 in. wide in limestone. Fractures 1/4 to 2 in. wide extended 120 ft through the detonation hole. A 50-qt charge of NGl was dynamited placed into a permeable zone at a depth of 42 ft in Green River oil shale. The explosion propagated to test holes drilled on 12 to 15-ft spacing. Effects of the explosion were observed by coring, Caliper logs, Downhole Camera surveys, elevation measurements and air-flow tests. Fracture improvement ratios on 8 test holes, determined from before and after flow tests, ranged from 2.3 to 19.1 and averaged 8.0. (Campbell-NWWA)

FATE OF PHOSPHORUS IN WASTE TREATMENT PROCESSES ENHANCED REMOVAL OF PHOSPHATE BY ACTIVATED SLUDGE,
W71-05262 05D

PREDATION
CAUSES OF OYSTER SPAT MORTALITY, CONDITIONS OF OYSTER SETTING BEDS, AND RECOMMENDATIONS FOR OYSTER BED MANAGEMENT,
W71-05202 05C

PREFERENCE FUNCTION
REVELATION OF PREFERENCE FOR A PUBLIC GOOD WITH IMPERFECT EXCLUSION,
W71-05239 06B

PRESSURE
LOW PRESSURE WET AIR OXIDATION OF SEWAGE SLUDGE,
W71-05271 05D

PRIMARY PRODUCTIVITY
PRIMARY PRODUCTION MEASUREMENTS ON A NATURAL PLANKTON BLOOM,
W71-04967 02I

PROCESS WASTES
WASTE CONTROL AND TREATMENT BY A CORN AND SOYBEAN PROCESSOR,
W71-05019 05D

PRODUCTIVITY
DEVELOPMENTAL HISTORY OF SCHOHSEE SHOWN BY MICROSCOPICAL AND CHEMICAL INVESTIGATIONS, (IN GERMAN),
W71-04963 02H

PROFILES
HIGH SNOWFIELDS OF THE ST. ELIAS MOUNTAINS,
W71-05100 02C

PROGRAM BUDGET
PROGRAM BUDGET FOR NATURAL RESOURCES ACTIVITIES,
W71-05232 06A

PROGRAM BUDGETING
PROGRAM BUDGETING,
W71-05229 06C

LIMITATIONS, RISKS AND PROBLEMS,
W71-05230 06C

PROGRAMMING
CONCEPTUAL FRAMEWORK FOR THE PROGRAM BUDGET,
W71-05231 06C

PROGRAMS
PROGRAM OF THE WATER RESOURCES DIVISION, TEXAS DISTRICT, FOR THE 1971 FISCAL YEAR AND SUMMARY OF DISTRICT ACTIVITIES DURING FISCAL YEAR 1970.
W71-04906 07C

THE STREAMFLOW DATA PROGRAM IN IOWA - EVALUATION OF THE PAST, PROPOSAL FOR THE FUTURE,
W71-05093 07C

PROJECT ANALYSIS
ANALYSIS OF PROJECTS FOR ECONOMIC GROWTH,
W71-05238 06B

PROJECT FEASIBILITY
WATER PROJECTS -- A CHANGING PERSPECTIVE,
W71-05195 06B

PROJECT PLANNING
PROGRAM OF THE WATER RESOURCES DIVISION, TEXAS DISTRICT, THE 1971 FISCAL YEAR AND SUMMARY OF DISTRICT ACTIVITIES DURING FISCAL YEAR 1970.
W71-04906 07C

THE STREAMFLOW DATA PROGRAM IN IOWA - EVALUATION OF THE PAST, PROPOSAL FOR THE FUTURE,
W71-05093 07C

COUNCIL ON ENVIRONMENTAL QUALITY STATEMENTS ON PROPOSED FEDERAL ACTION AFFECTING THE ENVIRONMENT.
W71-05180 06E

PROTEIN
DETERMINATION OF PROTEIN IN WASTE WATER,
W71-05029 05A

PROTEINS
UTILIZATION OF RESISTANT PROTEINS BY ACTIVATED SLUDGE,
W71-05027 05D

PROTOZOA
APPLICATION OF INDUSTRIAL PHOTOSYNTHESIS PROCESS TO WASTE WATER RENOVATION SYSTEMS,
W71-05267 05D

PUBLIC EDUCATION
PERCEPTION OF WATER RESOURCE INFORMATION SOURCES AND EDUCATIONAL NEEDS BY LOCAL OFFICIALS AND SPECIAL INTEREST GROUPS,
W71-04933 06B

PUBLIC EXPENDITURE BUDGETING
TOWARD A THEORY OF BUDGETING,
W71-05248 06B

PUBLIC GOOD
SOCIAL SCIENCES AND THE ENVIRONMENT,
W71-05245 06B

PUBLIC GOODS
REVELATION OF PREFERENCE FOR A PUBLIC GOOD WITH IMPERFECT EXCLUSION,
W71-05239 06B

PUBLIC HEALTH
ESTIMATING POPULATION EXPOSURE TO SELECTED METALS - MANGANESE,
W71-04947 05B

ESTIMATING POPULATION EXPOSURE TO SELECTED METALS - TITANIUM,
W71-04948 05B

PUBLIC INFORMATION
PERCEPTION OF WATER RESOURCE INFORMATION SOURCES AND EDUCATIONAL NEEDS BY LOCAL OFFICIALS AND SPECIAL INTEREST GROUPS,
W71-04933 06B

PUBLIC OPINION
PUBLIC OPPOSITION TO NUCLEAR POWER - AN INDUSTRY OVERVIEW,
W71-05126 05C

PUBLIC UTILITIES
MIDDLESEX WATER CO V BOARD OF PUBLIC UTIL COMM'RS (WATER COMPANY'S DUTY TO MAINTAIN WATER SUPPLY SYSTEM).
W71-05217 06E

PULP AND PAPER INDUSTRY
LIQUID WASTE IN THE PULP AND PAPER INDUSTRY,
W71-04902 05D

TREATMENT AND DISPOSAL OF EFFLUENT FROM A 450 TON PER DAY KRAFT PULP AND PAPER MILL INTO CLASSIFIED INLAND WATERS,
W71-05011 05D

FLUIDIZED-BED PROCESSES - A SOLUTION FOR INDUSTRIAL WASTE PROBLEMS,
W71-05022 05D

PLASTIC TRICKLING FILTER--ACTIVATED SLUDGE TREATMENT OF PAPER WASTES,
W71-05270 05D

PULP MILL WASTE DISPOSAL AT SPECIFIC INSTALLATIONS IN SWEDEN,
W71-05282 05D

PULP WASTES
LIQUID WASTE IN THE PULP AND PAPER INDUSTRY,
W71-04902 05D

CENTRIFUGES FOR PAPER MILL WASTE SLUDGE DEWATERING,
W71-05020 05D

CENTRIFUGAL DEWATERING OF PRIMARY PAPER INDUSTRY SLUDGES,
W71-05178 05D

PLASTIC TRICKLING FILTER--ACTIVATED SLUDGE TREATMENT OF PAPER WASTES,
W71-05270 05D

AUTOXIDATION OF WOOD DISTILLATION WASTES WITH OXYGEN,
W71-05273 05D

AERATED STABILIZATION OF BOARD MILL WHITE PAPER,
W71-05283 05D

PUMPING
COST OF PUMPING IRRIGATION WATER IN ARIZONA 1891 TO 1967,
W71-04851 03F

PUMPING TESTS
POROSITY AND DISPERSION CONSTANT CALCULATIONS FOR A FRACTURED CARBONATE AQUIFER USING THE TWO WELL TRACER METHOD,
W71-04859 02F

THE EFFECT OF STREAM DISCHARGE ON STREAMBED LEAKAGE TO A GLACIAL OUTWASH AQUIFER,
W71-04973 02F

PUMPS
KNOW YOUR MUD PUMP,
W71-05300 08C

PYRITE
ACID MINE DRAINAGE RESEARCH AT THE OHIO STATE UNIVERSITY,
W71-04999 05G

RADAR
SOIL MOISTURE DETECTION WITH IMAGING RADARS,
W71-04857 07B

RADAR(IMAGING)
SOIL MOISTURE DETECTION WITH IMAGING RADARS,
W71-04857 07B

RADAR(SIDE-LOCKING)
SOIL MOISTURE DETECTION WITH IMAGING RADARS,
W71-04857 07B

RADIATION BALANCE
A COMPARISON OF ENERGY BALANCE METHODS FOR ESTIMATING ATMOSPHERIC THERMAL RADIATION,
W71-04852 02D

RADIOACTIVE DATING
SILICON-32 HYDROLOGY,
W71-04885 02K

RADIOACTIVE WASTE DISPOSAL
PROJECT SALT VAULT RADIOACTIVE WASTE DISPOSAL IN A SALT MINE,
W71-05287 05D

RADIOACTIVE WELL LOGGING
A COMPUTER-ORIENTED GENERALIZED POROSITY-LITHOLOGY INTERPRETATION OF NEUTRON, DENSITY AND SONIC LOGS,
W71-04889 07C

RADIOACTIVITY
THE TREATMENT AND DISPOSAL OF RADIOACTIVE WASTES IN AN INDUSTRIAL LABORATORY PLANT,
W71-05176 05D

RADIOACTIVITY TECHNIQUES
VERTICAL MOLECULAR DIFFUSION OF XENON-133 GAS AFTER INJECTION UNDERGROUND,
W71-04977 05B

RADIOCHEMISTRY
THE TREATMENT AND DISPOSAL OF RADIOACTIVE WASTES IN AN INDUSTRIAL LABORATORY PLANT,
W71-05176 05D

RADIOECOLOGY
MODEL OF HYDROLOGIC REDISTRIBUTION OF RADIONUCLIDES AROUND NUCLEAR-EXCAVATED SEA-LEVEL CANALS,
W71-04882 05B

RADIOGRAPHIC TECHNIQUES
SINGLE-WELL TECHNIQUE USING P-32 FOR DETERMINING DIRECTION AND VELOCITY OF GROUNDWATER FLOW,
W71-04878 02F

RADIOISOTOPES
RADON IN GROUNDWATERS OF DOLOMITIC AND CALCAREOUS AQUIFER IN APULIA (SOUTHERN ITALY),
W71-04884 02K

THE TREATMENT AND DISPOSAL OF RADIOACTIVE WASTES IN AN INDUSTRIAL LABORATORY PLANT,
W71-05176 05D

RADIOISTOPES
CONTRIBUTION TO THE SELECTION OF RADIOACTIVE TRACERS FOR HYDROGEOLOGY (FRENCH),
W71-04883 07B

RADON
RADON IN GROUNDWATERS OF DOLOMITIC AND CALCAREOUS AQUIFER IN APULIA (SOUTHERN ITALY),
W71-04884 02K

RAIN GAGES
A RARE EVENT OF INTENSE RAINFALL,
W71-05060 02B

RAINDROP IMPACT
SPLASH AMOUNTS FROM WATERDROP IMPACT ON A SMOOTH SURFACE,
W71-04865 02J

RAINDROPS
SPLASH AMOUNTS FROM WATERDROP IMPACT ON A SMOOTH SURFACE,
W71-04865 02J

RAINFALL
A RARE EVENT OF INTENSE RAINFALL,
W71-05060 02B

RAINFALL DISPOSITION
FACTORS AFFECTING VARIATIONS OF MEAN ANNUAL RAINFALL IN ISRAEL,
W71-04898 02B

RAINFALL INTENSITY
EFFECTS OF MANURE DEPTH ON RUNOFF FROM SOUTHWESTERN CATTLE FEEDLOTS,
W71-04913 05B

A RARE EVENT OF INTENSE RAINFALL,
W71-05060 02B

RAINFALL-RUNOFF RELATIONSHIPS
THE EFFECT OF SELECTED HYDROLOGIC VARIABLES ON STREAM SALINITY,
W71-04897 02A

EFFECTS OF MANURE DEPTH ON RUNOFF FROM SOUTHWESTERN CATTLE FEEDLOTS,
W71-04913 05B

AVERAGE ANNUAL PRECIPITATION AND RUNOFF IN NORTH COASTAL CALIFORNIA,
W71-05096 07C

RAPPAHANNOCK RIVER
FLOOD PLAIN INFORMATION OF RAPPAHANNOCK RIVER, FREDERICKSBURG, SPOTSYLVANIA AND STAFFORD COUNTIES, VIRGINIA.
W71-05071 04A

RARE-EARTH ELEMENTS
USE OF RARE-EARTH ELEMENTS AS TRACERS IN ESTUARIES,
W71-04886 02L

RATES OF APPLICATION
EVAPORATION LOSSES IN SPRINKLER IRRIGATION,
W71-04938 02D

RECENT SEDIMENTS
TRACE ELEMENT AND ORGANIC CARBON ACCUMULATION IN THE MOST RECENT SEDIMENTS OF SOUTHERN LAKE MICHIGAN,
W71-05064 02J

RECHARGE
MATHEMATICAL MANAGEMENT MODEL--UNCONFINED AQUIFER,
W71-04931 02F

HYDROLOGIC AND PHOTOGEOLOGIC DETERMINATION OF RAINFALL, RUNOFF, AND GROUNDWATER RELATIONSHIPS IN A DOLOMITE AREA,
W71-04937 02A

A METHOD FOR RELATING INFILTRATION RATES TO STREAMFLOW RATES IN PERCHED STREAMS,
W71-04971 02F

RECIRCULATED WATER
NEW DEVELOPMENTS IN THE TREATMENT OF METAL FINISHING WASTES BY ION EXCHANGE OF RINSE WATERS,
W71-05002 05D

RECLAMATION
CONSERVATION, CONTROL, AND USE OF WATER RESOURCES OF THE MISSOURI RIVER BASIN.
W71-04986 06E

RECOVERY
CENTRIFUGES FOR PAPER MILL WASTE SLUDGE DEWATERING,
W71-05020 05D

RECOVERY COSTS
SODIUM HYDROXIDE RECOVERY IN THE TEXTILE INDUSTRY,
W71-05034 05D

RECREATION
FACTORS INFLUENCING THE RESIDENTIAL UTILIZATION OF RESERVOIR SHORELANDS IN THE SOUTHEAST,
W71-04934 06B

INSTITUTIONAL DESIGN FOR WATER QUALITY MANAGEMENT A CASE STUDY OF THE WISCONSIN RIVER, VOL. 4, SECTION E - COST FUNCTIONS FOR INFLUENCING WATER QUALITY SECTION F - RELATION OF PARTICIPATION IN OUTDOOR RECREATION AND PUBLIC ATTITUDES TOWARD WATER QUALITY,
W71-05038 05G

RECREATIONAL FACILITIES
RECREATION AND THE LOCAL ECONOMY - AN INPUT-OUTPUT MODEL OF A RECREATION-ORIENTED ECONOMY,
W71-04955 06B

RECYCLING
WATER QUALITY, THE STATE OF THE ART,
W71-05212 05G

RED LAKE RIVER BASIN(NORTHWESTERN
WATER RESOURCES OF THE RED LAKE RIVER WATERSHED,

NORTHWESTERN MINNESOTA,
W71-05114 07C

REFINERIES
THE TREATMENT OF REFINERY WASTE WATER WITH PARTICULAR CONSIDERATION OF PHENOLIC STREAMS,
W71-05030 05D

REFRACTORY MATERIALS
REMOVAL OF COD FROM WASTE WATER BY FLY ASH,
W71-05035 05D

REFRIGERATION
EFFECTS OF REFRIGERATED STORAGE ON THE CHARACTERISTICS OF WASTE,
W71-05169 05D

REGENERATION
REGENERATION OF HYDROCHLORIC ACID FROM WASTE PICKLE LIQUOR,
W71-05006 05D

REGIMEN
DESCRIPTION AND EVOLUTION OF SNOW AND ICE FEATURES AND SNOW SURFACE FORMS ON THE KASKAWULSH GLACIER,
W71-05097 02C

SNOW FACIES AND STRATIGRAPHY ON THE KASKAWULSH GLACIER,
W71-05098 02C

O-18/O-16 RATIOS IN SNOW AND ICE OF THE HUBBARD AND KASKAWULSH GLACIERS,
W71-05099 02C

REGIONAL PLANNING
WATER SUPPLY MANAGEMENT PLAN FOR MUSKEGON COUNTY,
W71-04945 06B

SOIL AND WATER CONSERVATION NEEDS INVENTORY, COOKE, GRAYSON AND FANNIN COUNTIES, TEXAS.
W71-05150 03F

REGRESSION ANALYSIS
ECONOMIC ANALYSIS OF WATER USE IN ILLINOIS AGRICULTURE,
W71-04935 06B

RELEVANT ALTERNATIVES
CONCEPTUAL FRAMEWORK FOR THE PROGRAM BUDGET,
W71-05231 06C

REMEDIES
EDWARD BALF CO V HARTFORD ELECTRIC CO (REMEDIES FOR OBSTRUCTION OF NAVIGABLE RIVER).
W71-04961 06E

REMOTE SENSING
SOIL MOISTURE DETECTION WITH IMAGING RADARS,
W71-04857 07B

PASSIVE MICROWAVE MEASUREMENTS OF SNOW, SOILS, AND OCEANOGRAPHIC PHENOMENA,
W71-04942 07B

REMOTE SENSING OF HYDROLOGIC RESOURCES IN THE GREAT PLAINS, REPORT 1,
W71-05091 07B

AIRBORNE TEMPERATURE SURVEYS OF LAKE MICHIGAN, OCTOBER, 1966 AND 1967,
W71-05120 07B

GREAT LAKES THERMAL STUDIES USING INFRARED IMAGERY,
W71-05123 07B

RESERVOIR DESIGN
A COMPARATIVE STUDY OF CRITICAL DROUGHT SIMULATION,
W71-04861 04A

RESERVOIR EVAPORATION
EVAPORATION REDUCTION WITH FLOATING GRANULAR MATERIALS,
W71-05138 03B

RESERVOIR LEAKAGE
A NEW METHOD OF DETECTING LEAKS IN RESERVOIRS OR CANALS USING LABELLED BITUMEN EMULSIONS (FRENCH),
W71-04879 04A

METHOD OF DETERMINING LEAKAGE VELOCITIES THROUGH THE BOTTOM OF RESERVOIRS,
W71-04880 04A

RESERVOIR LEAKAGE GAGE
METHOD OF DETERMINING LEAKAGE VELOCITIES THROUGH THE BOTTOM OF RESERVOIRS,
W71-04880 04A

RESERVOIR OPERATION
INSTITUTIONAL DESIGN FOR WATER QUALITY MANAGEMENT A CASE STUDY OF THE WISCONSIN RIVER, VOL. 2, SECTION B-HYDROLOGY,
W71-05037 05G

RESERVOIR STAGES
ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR MOUNTAIN CREEK, TRINITY RIVER BASIN, TEXAS, 1969,
W71-05049 07C

RESERVOIR STORAGE
IRRIGATION FROM UPSTREAM WATERSHED RETENTION RESERVOIRS IN OKLAHOMA,
W71-05197 03F

RESERVOIR YIELD
ANALYSIS OF RESERVOIR YIELD,
W71-05081 04A

RESERVOIRS
FACTORS INFLUENCING THE RESIDENTIAL UTILIZATION OF RESERVOI SHORELANDS IN THE SOUTHEAST,
W71-04934 06B

INSTITUTIONAL DESIGN FOR WATER QUALITY MANAGEMENT A CASE STUDY OF THE WISCONSIN RIVER, VOL. 2, SECTION B-HYDROLOGY,
W71-05037 05G

RESOURCE ALLOCATION
REVELATION OF PREFERENCE FOR A PUBLIC GOOD WITH IMPERFECT EXCLUSION,
W71-05239 06B

RESPIRATION
THE EFFECT OF SEA WATER ON CARBON DIOXIDE EXCHANGE BY THE HALOPHYTE LIMONIUM CALIFORNICUM (BOISS.) HELLER,
W71-05196 02I

RETENTION TIME
TEMPERATURE AND RETENTION TIME RELATIONSHIPS IN THE ACTIVATED SLUDGE PROCESS,
W71-05285 05D

REVERSE OSMOSIS DESALINATION
DIFFUSION AND REVERSE OSMOSIS THROUGH POLYMER MEMBRANES,
W71-04943 03A

REVERSE ROTARY DRILLING
APPLICATION OF ROTARY DRILLING TO WATER WELLS,
W71-05307 08A

REVIEWS
PROGRAM OF THE WATER RESOURCES DIVISION, TEXAS DISTRICT, FO THE 1971 FISCAL YEAR AND SUMMARY OF DISTRICT ACTIVITIES DURING FISCAL YEAR 1970.
W71-04906 07C

AIR POLLUTANTS AFFECTING THE PERFORMANCE OF DOMESTIC ANIMAL - A LITERATURE REVIEW.
W71-04910 05C

RIPARIAN LAND
ADARAY REALTY CORP V FABER (RESTORATION OF UPLAND TITLE BY FILLING SUBMERGED LAND).
W71-04988 06E

RIPARIAN RIGHTS
IN RE JAMAICA BAY (COMPENSATION FOR CONDEMNATION OF RIPARIA RIGHT OF ACCESS).
W71-05235 06E

RIPPLE MARKS
SAND WAVES IN THE SOUTHERN BIGHT OF THE NORTH SEA,
W71-04876 02J

RISK
LIMITATIONS, RISKS AND PROBLEMS,
W71-05230 06C

THE EVALUATION OF RISKY INTERRELATED INVESTMENTS,
W71-05241 06C

RIVER BASIN DEVELOPMENT
WILD RIVERS -- METHODS FOR EVALUATION,
W71-04930 06B

CONSERVATION, CONTROL, AND USE OF WATER RESOURCES OF THE MISSOURI RIVER BASIN.
W71-04986 06E

RIVERS
INSTITUTIONAL DESIGN FOR WATER QUALITY MANAGEMENT A CASE STUDY OF THE WISCONSIN RIVER, VOL. 2, SECTION B-HYDROLOGY,
W71-05037 05G

EXPERIMENTAL FLUME INVESTIGATION OF HYDRAULIC TRANSIENTS IN RIVER-RESERVOIR SYSTEMS,
W71-05087 02E

RIVERS AND HARBORS ACT
PERMITS FOR DISCHARGES OR DEPOSITS INTO NAVIGABLE WATERS.
W71-05184 06E

ROCK DESTRUCTION MECHANISMS
NOVEL DRILLING TECHNIQUES,
W71-05291 08A

ROCK DRILLABILITY
A NEW APPROACH TO INTERPRETING ROCK DRILLABILITY,
W71-05313 08E

ROCK MECHANICS
ANNOTATED TABLES OF STRENGTH AND ELASTIC PROPERTIES OF ROCKS,
W71-05312 08E

ROCK-BIT DESIGN
NEWS TOOLS AND PROCEDURES FOR BETTER DRILLING OPERATIONS,
W71-05316 08A

ROCK-BIT SELECTION
NEWS TOOLS AND PROCEDURES FOR BETTER DRILLING OPERATIONS,
W71-05316 08A

ROCK-BLASTING MECHANISM
EXPLOSIVES RESEARCH TO IMPROVE FLOW THROUGH LOW PERMEABILITY ROCK,

W71-05322 08H

ROSWELL ARTESIAN BASIN(NEW MEXICO)
IRRIGATION WATER REQUIREMENTS FOR CROP PRODUCTION IN THE ROSWELL ARTESIAN BASIN,
W71-05066 04B

ROTARY DRILLING
PETROLEUM ENGINEERING, DRILLING AND WELL COMPLETIONS,
W71-05296 08B

BEST CONSTANT WEIGHT AND POTARY SPEED FOR ROTARY ROCK BITS,
W71-05297 08C

THE PERFECT-CLEANING THEORY OF ROTARY DRILLING,
W71-05304 08A

APPLICATION OF ROTARY DRILLING TO WATER WELLS,
W71-05307 08A

A NEW APPROACH TO INTERPRETING ROCK DRILLABILITY,
W71-05313 08E

DRILLING FOR THE MAN ON THE RIG,
W71-05314 08A

NEWS TOOLS AND PROCEDURES FOR BETTER DRILLING OPERATIONS,
W71-05316 08A

NEW EQUIPMENT AND OPTIMUM DRILLING TECHNIQUES MAKE FOR BETTER DRILLING PRACTICES,
W71-05318 08A

ROTARY DRILLING BIT DESIGN
ROTARY DRILLING BITS.
W71-05298 08C

ROUTING
FLOCD RCUTING THROUGH STORM DRAINS PART I. SOLUTION OF PROBLEMS OF UNSTEADY FREE SURFACE FLOW IN STORM DRAINS,
W71-04890 04A

RUNOFF
NUTRIENTS IN STREAMS DRAINING WOODLAND AND FARMLAND NEAR COSHOCTON, OHIO,
W71-04856 05B

WATER RESOURCES OF EUROPE,
W71-04899 02A

HYDROLOGIC AND PHOTOGEOLOGIC DETERMINATION OF RAINFALL, RUNOFF, AND GROUNDWATER RELATIONSHIPS IN A DOLOMITE AREA,
W71-04937 02A

RUNOFF RESPONSE VARIABLES
STORM RUNOFF RESPONSE FROM ROADBUILDING AND LOGGING ON SMALL WATERSHEDS IN THE OREGON COAST RANGE,
W71-04968 04C

RUSSIAN TURBODRILLS
RUSSIAN TURBODRILLS.....HOW GOOD ARE THEY.
W71-05306 08C

SAFETY
ENGINEERING SAFETY FACTORS AND THEIR INFLUENCE ON SITING PRACTICES FOR NUCLEAR POWER PLANTS IN THE EUROPEAN COMMUNITIES,
W71-05129 05C

SALINE SOILS
SOME RECENT RESEARCH ON LAND DRAINAGE,
W71-05102 04A

SALINE WATER
OBJECTIVES OF A CURRENT STUDY OF SALINE GROUNDWATER IN THE TULAROSA BASIN, NEW MEXICO,
W71-05067 04B

THE EFFECT OF SEA WATER ON CARBON DIOXIDE EXCHANGE BY THE HALOPHYTE LIMONIUM CALIFORNICUM (BOISS.) HELLER,

SKAGIT RIVER BASIN
WILD RIVERS -- METHODS FOR EVALUATION,
W71-04930 06B

SLAUGHTERHOUSE WASTES
FIELD STUDIES ON AN ANAEROBIC LAGOON TREATING SLAUGHTERHOUSE WASTE,
W71-05000 05D

SLIMS RIVER(CANADA)
MORPHOLOGY OF THE SLIMS RIVER,
W71-05101 02J

SLUDGE
CENTRIFUGAL DEWATERING OF PRIMARY PAPER INDUSTRY SLUDGES,
W71-05178 05D

PRECIPITATION OF HIGH DENSITY METALLIC HYDROXIDES FOR RECOVERY OR DISPOSAL,
W71-05266 05D

USE OF OXYGEN IN SLUDGE STABILIZATION,
W71-05281 05D

SLUDGE TREATMENT
USE OF OXYGEN IN SLUDGE STABILIZATION,
W71-05281 05D

TEMPERATURE AND RETENTION TIME RELATIONSHIPS IN THE ACTIVATED SLUDGE PROCESS,
W71-05285 05D

SLUDGE VOLUME INDEX
EFFECT OF CENTRATE FROM SOLID BOWL CENTRIFUGE ON ACTIVATED SLUDGE PROCESS,
W71-05008 05D

SLURRIES
ULTRAFILTRATIVE DEWATERING OF SPENT POWDERED CARBON,
W71-05158 05D

SMALL WATERSHEDS
STORM RUNOFF RESPONSE FROM ROADBUILDING AND LOGGING ON SMALL WATERSHEDS IN THE OREGON COAST RANGE,
W71-04968 04C

SNOW
PASSIVE MICROWAVE MEASUREMENTS OF SNOW, SOILS, AND OCEANOGRAPHIC PHENOMENA,
W71-04942 07B

SNOW FALL
THE EXPERIMENTAL MODIFICATION OF LAKE-EFFECT WEATHER,
W71-04951 02B

SNOWFIELDS
ICEFIELD RANGES RESEARCH PROJECT SCIENTIFIC RESULTS, VOLUME 1,
W71-05103 02C

SNOWMELT
ENERGY EXCHANGE AND LATE SEASON SNOWMELT IN A SMALL OPENING IN COLORADO SUBALPINE FOREST,
W71-04863 02C

FLOOD OF MARCH 1968 ON THE SUDBURY, ASSABET, AND CONCORD RIVERS, MASSACHUSETTS,
W71-04980 02E

DESCRIPTION AND EVOLUTION OF SNOW AND ICE FEATURES AND SNOW SURFACE FORMS ON THE KASKAWULSH GLACIER,
W71-05097 02C

SNOW FACIES AND STRATIGRAPHY ON THE KASKAWULSH GLACIER,
W71-05098 02C

SNOWPACKS
HIGH SNOWFIELDS OF THE ST. ELIAS MOUNTAINS,
W71-05100 02C

SNOWSTORMS
GREAT LAKES SNOWSTORMS. PART 1. CLOUD PHYSICS ASPECTS,
W71-05153 02C

GREAT LAKES SNOWSTORMS, PART 2. SYNOPTIC AND CLIMATOLOGICAL ASPECTS,
W71-05154 02H

SOCIAL ASPECTS
FACTORS INFLUENCING THE RESIDENTIAL UTILIZATION OF RESERVOIR SHORELANDS IN THE SOUTHEAST,
W71-04934 06B

SOCIAL COST
THE DEFINITION AND MEASUREMENT OF DROUGHT LOSSES THE NORTHEAST DROUGHT OF 1962-1966,
W71-05233 06C

SOCIAL PARTICIPATION
PERCEPTION OF WATER RESOURCE INFORMATION SOURCES AND EDUCATIONAL NEEDS BY LOCAL OFFICIALS AND SPECIAL INTEREST GROUPS,
W71-04933 06B

SOCIAL RATE OF RETURN
CHOICE OF TECHNIQUE IN THE PUBLIC SECTOR A SIMPLIFICATION,
W71-05240 06B

SOCIAL TIME PREFERENCE
CHOICE OF TECHNIQUE IN THE PUBLIC SECTOR A SIMPLIFICATION,
W71-05240 06B

SODIUM HYDROXIDE
SODIUM HYDROXIDE RECOVERY IN THE TEXTILE INDUSTRY,
W71-05034 05D

SOFT GROUND TUNNELING
A SYSTEMS STUDY OF SOFT GROUND TUNNELING,
W71-05255 08A

SOFT-WATER SUPPLY
SOFT WATER SUPPLY FOR URBAN CONSUMPTION, A FEASIBILITY STUDY,
W71-05215 04B

SOIL CONSERVATION
SOIL AND WATER CONSERVATION NEEDS INVENTORY, COOKE, GRAYSON AND FANNIN COUNTIES, TEXAS.
W71-05150 03F

SOIL ENGINEERING
USE OF GEOPHYSICAL LOGS IN SOIL ENGINEERING,
W71-05310 08D

SOIL MOISTURE
SOIL MOISTURE DETECTION WITH IMAGING RADARS,
W71-04857 07B

REMOTE SENSING OF HYDROLOGIC RESOURCES IN THE GREAT PLAINS, REPORT 1,
W71-05091 07B

SOIL PRESSURE
LABORATORY LOAD TESTS ON BURIED FLEXIBLE PIPE,
W71-04954 08A

SOIL TYPES
MINERALOGY OF A PLAYA SOIL AND UNDERLYING SEDIMENTS FROM THE HIGH PLAINS MEDIUM-TEXTURED SOIL ZONE,
W71-05112 02J

SOIL WATER MOVEMENT
HYSTERESIS DURING INFILTRATION AND REDISTRIBUTION IN A SOIL COLUMN AT DIFFERENT INITIAL WATER CONTENTS,
W71-04858 02G

FLOW CELL SYSTEM FOR MISCIBLE DISPLACEMENT EXPERIMENTS,
W71-04868 02G

TRANSPORT ANALYSIS-BASIC PREDICTIVE APPROACH OF THE MOVEMENT OF POLLUTANTS THROUGH SOIL,
W71-05264 05B

SOILS
PASSIVE MICROWAVE MEASUREMENTS OF SNOW, SOILS, AND OCEANOGRAPHIC PHENOMENA,
W71-04942 07B

STABILITY OF CLOSED HORIZONTAL DRAINAGE IN THE GOLODNAYA STEPPE,
W71-05254 08D

SOIL-WATER-PLANT RELATIONSHIPS
REMOTE SENSING OF HYDROLOGIC RESOURCES IN THE GREAT PLAINS, REPORT 1,
W71-05091 07B

SOLAR RADIATION
A COMPARISON OF ENERGY BALANCE METHODS FOR ESTIMATING ATMOSPHERIC THERMAL RADIATION,
W71-04852 02D

ENERGY EXCHANGE AND LATE SEASON SNOWMELT IN A SMALL OPENING IN COLORADO SUBALPINE FOREST,
W71-04863 02C

HIGH SNOWFIELDS OF THE ST. ELIAS MOUNTAINS,
W71-05100 02C

TESTS OF SOLAR RADIATION MODELS IN THREE FOREST CANOPIES,
W71-05131 02D

SOLID WASTES
HYDROLOGIC IMPLICATIONS OF SOLID-WASTE DISPOSAL,
W71-05094 05B

SOLUBLE ORGANICS
INVESTIGATION OF A HIGH-PRESSURE FOAM WASTE WATER TREATMENT PROCESS,
W71-05156 05D

SOLUTES
GEOCHEMICAL TRENDS IN THE OCCURRENCE AND MIGRATION FORMS OF GOLD IN NATURAL WATER,
W71-04896 02K

SOLVENT EXTRACTIONS
A FIELD COUNTERCURRENT EXTRACTOR FOR WATER POLLUTANTS,
W71-05269 05D

SONIC WELL LOGGING
A COMPUTER-ORIENTED GENERALIZED POROSITY-LITHOLOGY INTERPRETATION OF NEUTRON, DENSITY AND SONIC LOGS,
W71-04889 07C

SOUTH CAROLINA
A RECONNAISSANCE OF THE SANTEE RIVER ESTUARY, SOUTH CAROLINA,
W71-04908 02L

SOYBEANS
WASTE CONTROL AND TREATMENT BY A CORN AND SOYBEAN PROCESSOR,
W71-05019 05D

SPACECRAFT ENVIRONMENTS
SPECIALIZED HALOGEN GENERATOR PATENT APPLICATION,
W71-04941 05D

SPECIFIC CONDUCTANCE-IONIC STRENGTH RELATIONS
SPECIFIC CONDUCTANCE AS A MEANS OF ESTIMATING IONIC STRENGTH,
W71-04975 02K

SPECTROPHOTOMETRY
SPECTROPHOTOMETRIC DETERMINATION OF HYDROGEN SULFIDE IN

NATURAL WATERS,
W71-05109 02K

SPIRAL GENERATION
USE OF STYROFOAM FOR TRICKLING FILTER COVERS,
W71-05025 05D

SPLASH EROSION
SPLASH AMOUNTS FROM WATERDROP IMPACT ON A SMOOTH SURFACE,
W71-04865 02J

SPOT MORTALITY
CAUSES OF OYSTER SPAT MORTALITY, CONDITIONS OF OYSTER SETTING BEDS, AND RECOMMENDATIONS FOR OYSTER BED MANAGEMENT,
W71-05202 05C

SPRAY IRRIGATION
SPRAY IRRIGATION-A POSITIVE APPROACH TO PERPLEXING PROBLEM,
W71-05165 05D

SPRINKLER IRRIGATION
EVAPORATION LOSSES IN SPRINKLER IRRIGATION,
W71-04938 02D

STABILIZATION
USE OF OXYGEN IN SLUDGE STABILIZATION,
W71-05281 05D

STABLE ISOTOPES
STABLE CARBON ISOTOPES IN BLUE-GREEN ALGAL MATS,
W71-04873 02L

USE OF RARE-EARTH ELEMENTS AS TRACERS IN ESTUARIES,
W71-04886 02L

O-18/O-16 RATIOS IN SNOW AND ICE OF THE HUBBARD AND KASKAWULSH GLACIERS,
W71-05099 02C

STANDARDS
WASTE HEAT AND THE WATER ENVIRONMENT,
W71-05130 05C

STARVATION
CAUSES OF OYSTER SPAT MORTALITY, CONDITIONS OF OYSTER SETTING BEDS, AND RECOMMENDATIONS FOR OYSTER BED MANAGEMENT,
W71-05202 05C

STATISTICAL HYDROLOGY
STATISTICAL RELATIONSHIPS BETWEEN STORM AND URBAN WATERSHED CHARACTERISTICS,
W71-05144 04A

STATISTICAL METHODS
ANALYSIS OF RESERVOIR YIELD,
W71-05081 04A

STEAM
VAPOR-DOMINATED HYDROTHERMAL SYSTEMS COMPARED WITH HOT-WATER SYSTEMS,
W71-05059 02K

STEEL PIPES
LABORATORY LOAD TESTS ON BURIED FLEXIBLE PIPE,
W71-04954 08A

STORM DRAINS
FLOOD ROUTING THROUGH STORM DRAINS PART I. SOLUTION OF PROBLEMS OF UNSTEADY FREE SURFACE FLOW IN STORM DRAINS,
W71-04890 04A

FLOOD ROUTING THROUGH STORM DRAINS PART II. PHYSICAL FACILITIES AND EXPERIMENTS,
W71-04891 04A

FLOOD ROUTING THROUGH STORM DRAINS PART III. EVALUATION OF GEOMETRIC AND HYDRAULIC PARAMETERS,
W71-04892 04A

STORM RUNOFF
STORM RUNOFF RESPONSE FROM ROADBUILDING AND LOGGING ON SMALL WATERSHEDS IN THE OREGON COAST RANGE,
W71-04968 04C

STRATIFICATION
DISPOSAL OF TITANIUM DIOXIDE WASTE IN A STRATIFIED ESTUARY,
W71-05159 05D

FISHERY IMPLICATIONS ASSOCIATED WITH PROLONGED TEMPERATURE AND OXYGEN STRATIFICATIONS,
W71-05209 05C

STREAMFLOW
THE EFFECT OF SELECTED HYDROLOGIC VARIABLES ON STREAM SALINITY,
W71-04897 02A

A RECONNAISSANCE OF THE SANTEE RIVER ESTUARY, SOUTH CARCLINA,
W71-04908 02L

EVALUATION OF THE STREAMFLOW DATA PROGRAM FOR ARKANSAS,
W71-04974 07C

ANALYSIS OF WATER TEMPERATURE VARIATIONS IN LARGE RIVER,
W71-05048 02K

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR MOUNTAIN CREEK, TRINITY RIVER BASIN, TEXAS, 1969,
W71-05049 07C

THE STREAMFLOW DATA PROGRAM IN IOWA - EVALUATION OF THE PAST, PROPOSAL FOR THE FUTURE,
W71-05093 07C

STREAMFLOW DATA(IOWA)
THE STREAMFLOW DATA PROGRAM IN IOWA - EVALUATION OF THE PAST, PROPOSAL FOR THE FUTURE,
W71-05093 07C

STREAMFLOW FORECASTING
A COMPARATIVE STUDY OF CRITICAL DROUGHT SIMULATION,
W71-04861 04A

STREAMS
SHELDON V SEVIGNY (BOUNDARY OF PROPERTY ABUTTING ON A STREAM).
W71-05189 06E

STYROFOAM
USE OF STYROFOAM FOR TRICKLING FILTER COVERS,
W71-05025 05D

SUBSURFACE INVESTIGATIONS
A SYSTEMS STUDY OF SOFT GROUND TUNNELING,
W71-05255 08A

SUDBURY RIVER(MASS)
FLOOD OF MARCH 1968 ON THE SUDBURY, ASSABET, AND CONCORD RIVERS, MASSACHUSETTS,
W71-04980 02E

SUFFOCATION
CAUSES OF OYSTER SPAT MORTALITY, CONDITIONS OF OYSTER SETTING BEDS, AND RECOMMENDATIONS FOR OYSTER BED MANAGEMENT
W71-05202 05C

SULFATES
BIOGEOCHEMICAL INVESTIGATIONS IN THE RUDNYY ALTAY,
W71-04895 02K

SUNFISH
A COMPARISON OF THE TOXICITY OF SOME COMMON INDUSTRIAL WASTE COMPONENTS TESTED INDIVIDUALLY AND COMBINED,
W71-05205 05C

SUNFISHES
CHRONIC EFFECTS OF METHOXYLCHLOR ON BLUEGILLS AND AQUATIC INVERTEBRATES,
W71-05206 05C

SURF
THE BREAKING OF WATER WAVES,
W71-05055 02E

SURFACE WATERS
SILICON-32 HYDROLOGY,
W71-04885 02K

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the EPA-Water Quality Office, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.

Supported by the Environmental Protection Agency in cooperation with WRSIC.

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Methods for chemical and biological identification and measurement of pollutants at the Analytical Quality Control Laboratory of the Water Quality Office of the Environmental Protection Agency.
- Coastal pollution at the Oceanic Research Institute.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 4, NUMBER 11
JUNE 1, 1971

W71-05335 -- W71-05835

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 4, NUMBER 11
JUNE 1, 1971

W71-05335 -- W71-05835

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency, Water Quality Office. A directory of the Centers appears on inside back cover.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ABSTRACT SOURCES

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

B. Aqueous Solutions and Suspensions

)LYWATER AND POLYPOLLUTANTS,
rkbeck Coll., London (England). Dept. of ystallography.
Barnes, I. Cherry, J. L. Finney, and S. Petersen.
ature, Vol 230, No 5288, p 31-33, March 5, 71. 3 p, 26 ref.

escriptors: *Gels, *Water types, *Water proper-s, *Water chemistry, Laboratory tests, ethodology, Investigations, Pollutants, Silica, ondensation, Aqueous solutions, Water structure. entifiers: *Anomalous water, *Polywater.

me careful experiments and a close look at the erature of polywater give no reason to believe at any new phenomenon has been discovered. ntamination could account for the observed ef-cts. The degrees of anomality in the samples alyzed were determined chiefly from observa-ns on the phase separation effects, the gel-like idue obtained after evaporation, and the shape the density-temperature curve obtained after rtain corrections had been made for the effect of narrow capillary bore. The method of produc-n was continually refined so as to eliminate as ny sources of contamination as possible. It was ncluded that the most common sources of con-nination in the general production of anomalous ter are as follows: (1) Gross salt contamination, surface migration and/or vapor transport, when t solution methods of production are used, (2) pillary residues (nitrogenous or silicaceous) ulting from the capillary 'cleaning' process, (3) aching out of the intrinsic glass components (sil-n and sodium) from the capillary walls, and (4) rface migration and vapor transport of contami-nts inherent in the apparatus. (Woodard-USGS) 71-05346

FFUSIVITY OF OXYGEN IN AQUEOUS ECTROLYTE SOLUTIONS,

scriptors: *Diffusivity, *Dissolved oxygen, lectrolytes, *Aqueous solutions, Diffusion, ter chemistry, Chemical reactions, Oxidation, exchange, Biochemistry, Oxygen.
ntifiers: *Oxygen diffusion.

e diffusivity of dissolved oxygen in aqueous elec-lyte solutions was measured over an extended ncentration range of the electrolytes. Sodium n-cylsulfonate, sodium 2, 4-dimethylbenzenesul-ate, sodium p-dodecylbenzenesulfonate, sodium oride, sodium sulfate, and sodium phosphate re used in this investigation. The concentration ge of the electrolytes extended to 2000 ppm for three sulfonates, 2 M for the chloride, 0.9 M for sulfate and 0.05 M for the phosphate. The dif-ion coefficients of dissolved oxygen in all six tems varied with the concentration of elec-lytes. The ratio of the diffusion coefficient of solved oxygen in electrolyte solutions to that in e water is linear with respect to the square root electrolyte concentrations for the chloride and sphate solutions and for the dilute solutions of 4-dimethylbenzenesulfonate and p-dodecyl-zenesulfonate; sulfate and n-decylsulfonate utions do not demonstrate this linear behavior. e results are discussed in terms of Eyring's 'hole' ory for diffusion and viscous flow processes, and Stokes-Einstein model for diffusivity and cosity. ANOMALOUS WATER NOT POLYWATER,
Unilever Ltd., Port Sunlight (England). Unilever Research Lab.
B. A. Pethica, W. K. Thompson, and W. T. Pike.
Nature Physical Science, Vol 229, No 1, p 21-22, January 4, 1971. 2 p, 9 ref.

Descriptors: *Water types, *Water properties, *Water sources, Gels, Investigations, Methodology, Testing, Test procedures, Spectrometers, Laboratory tests, Water chemistry, Silica.
Identifiers: *Anomalous water, *Polywater, Mass spectrometer.

A number of workers have shown that there is good reason to doubt that anomalous water can be regarded as a single substance. A plausible scheme for the formation of silica sols has been outlined. The high refractive index of concentrated anomalous water reported could well be ascribed to a silicate. Supporting this view are the further results of the mass spectra examination of anomalous water. The mass spectrometric data are particularly important because of claims that anomalous water can be distilled and thus freed from involatile impurities. Repeated investigations of anomalous water on an AEI MS 902 mass spectrometer, however, with both a micro glass inlet system and direct insertion techniques under a variety of instrumental conditions (for example, low ionizing voltage, varied source temperatures) have failed to show any such ions. Considering these findings, we feel strongly that anomalous water is not polywater, and until conclusive evidence to the contrary is obtained the possibility still exists that it is a gel or solution of silicates or other materials. MICROWAVE DIELECTRIC MEASUREMENTS ON ANOMALOUS WATER,
Cold Regions Research and Engineering Lab., Hanover, N.H. and Dartmouth Coll., Hanover, N.H. Dept. of Physics and Astronomy.
P. Hoekstra, G. Swinzow, S. Ackley, and W. T. Doyle.
Nature Physical Science, Vol 229, No 3, p 92-94, January 18, 1971. 3 p, 3 fig, 1 tab, 16 ref.

Descriptors: *Water chemistry, *Gels, *Condensation, *Water types, *Water properties, Research equipment, Methodology, Test procedures, Investigations, Laboratory tests, Electrical properties.
Identifiers: *Anomalous water, *Capillaries, Pyrex capillary tubing.

As part of a continuing investigation of the properties of water adsorbed on silicate surfaces, an analysis of the dielectric and thermochemical properties of the anomalous water substance formed in glass capillaries in such conditions was made. Capillaries were drawn from thick-walled 'Pyrex' capillary tubing (6 to 7 mm outer diameter, 3/4 to 1-1/4 mm inner diameter) by heating the glass in a flame of natural gas and oxygen. Columns of liquid were formed in approximately5% of the capillaries exposed. In most cases liquid columns did not exceed 1 to 2 mm in length; a few columns were longer than 5 mm. Often one capillary contained more than one column. A correlation was found between the dilatometric and dielectric behavior of anomalous water grown in small glass capillaries. Samples that exhibited the anomalous thermal behavior reported by other investigators showed normal dielectric behavior; samples that did not freeze when repeatedly cooled to -60 deg C had a dielectric constant and a dielectric loss less than those of normal water. 02. WATER CYCLE

2A. General

A LABORATORY CATCHMENT AND ASSOCIATED INSTRUMENTATION,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
K. C. Das, and L. F. Huggins.
Paper No 70-530 presented at 1970 Annual Meeting of American Society of Agricultural Engineers, Minneapolis, Minnesota, July 7-10, 1970. 20 p, 8 fig, 1 tab, 18 ref. OWRR Project B-016-IND (1).

Descriptors: *Overland flow, *Rainfall-runoff relationships, *Hydraulic models, Model studies, Analog computers, Simulated rainfall, Hydraulic similitude, Data collections, Data processing, Instrumentation.
Identifiers: Laboratory watersheds, Watershed models.

To study in the laboratory the rainfall-runoff relationship, an experimental watershed consists of a rainfall similator, flow plane, pressure transducer to measure the depth of water on the flow plane, weighing device to measure the accumulated volume and rate of runoff, and a vertical force measuring device to determine the detention volume on the catchment. The transducer signals are sent from the laboratory to a remote analog computer where the signals are amplified and analyzed before recording on magnetic tape. Initital test results indicate that such data can be acquired with good precision and that an on-line analysis capability greatly expands the scope of feasible experiments. (Knapp-USGS)

ROLE OF INFILTRATION IN NONLINEAR WATERSHED ANALYSIS PROCESSES,
California Univ., Davis. Dept. of Water Science and Engineering.
J. Amorocho.
American Society of Agricultural Engineers Transactions, Vol 10, No 3, p 396-399, 404, 1967. 5 p, 7 fig, 13 ref. OWRR Project B-005-CAL (8).

Descriptors: *Infiltration, *Surface-groundwater relations, *Watersheds (Basins), *Model studies, Equations, Precipitation (Atmospheric), Vegetation, Hydrology, Hydrologic cycle, Evaporation, Soil moisture, Streamflow, Low flow, Groundwater movement, Water storage, Runoff, Sorption, Permeability.

If the ground surface of a watershed is viewed as the locus of the points of application of the net input to a hydrologic system (gross precipitation over the vegetative canopy minus interception), infiltration is then the first major branching process whereby the system becomes divided into two principal components: (1) a subsystem involving surface storage and translation elements and (2) a subsystem with groundwater storage and translation elements. Two principal types of equivalent systems have been proposed for the representation of the hydrologic cycle. One is the result of what has been termed 'hydrologic synthesis,' and the

other results from 'nonlinear functional analysis.' In synthesis, a group of components representing major watershed mechanisms are linked in such a way that they operate by cascading and branching in some logical fashion in order to convert the input into an output approximating the measured outflow of the prototype. Each one of the components has a known structure and its parameters are adjusted and optimized so that a resonable matching between predicted and recorded outflows results. With the general structure of the synthetic models of the hydrologic cycle established, questions relative to the differences between the infiltration components of the models and the prototype are examined. REPRESENTATIVE BASINS OF NEW ZEALAND-1970.
Ministry of Works, Wellington (New Zealand). Water and Soil Div.

New Zealand Ministry of Works, Water and Soil Division Miscellaneous Hydrological Publication No 7, 1970. 291 p, 3 fig, 16 ref.

Descriptors: *Water resources, *Hydrologic data, *International Hydrological Decade, *Surface waters, *Rainfall-runoff relationships, Geology, Streamflow, Topography, Vegetation, Land use, Data collections, Instrumentation, Stream gages, Soil moisture, Planning, Model studies, Maps, Watersheds (Basins).
Identifiers: *New Zealand.

This publication has been produced as part of New Zealand's contribution to the International Hydrological Decade, 1964-75. The selection of representative basins in New Zealand is based on the fundamental assumption that each individual basin is representative of its hydrological region and that the areas of the basins would be uniformly distributed between the desirable limitations of 1 and 250 square kilometers. This distribution of areas is of particular value in hydrological prediction studies, which use data from part of or the entire network. It is unlikely that any one basin is representative of all the hydrological characteristics of its region; in general it will represent the most dominant features. For instance, in the Hokianga region, where a low-flow-recession study has shown the extreme variability of the recession constants (0.47-0.95), the soil type in all catchments is the same (podzolic clays), but the lithology is variable because of the presence of volcanic outcrops. It appears that surface flows are also similar within the region. Representativeness for low flows has been tested on a large scale in Northland in the course of a water resources investigation. High-flow correlations between gaging stations in the same catchment or in adjacent catchments to establish missing stage records are presented. The text descriptions accompanying each basin map follow the pattern recommended by UNESCO. (Woodard-USGS)

WATER RESOURCES - APPENDIX V OF COLUMBIA-NORTH PACIFIC REGION COMPREHENSIVE FRAMEWORK STUDY,
Pacific Northwest River Basins Commission, Vancouver, Wash.
G. L. Bodhaine, H. D. Hafterson, M. J. Mundorff, and John Summersett.
April 1970. Vol 1 (Subregion 1-6), p 1-543; Vol 2 (Subregion 7-12), p 544-1022. 897 fig, 497 tab, 206 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Hydrologic data, *Pacific Northwest U.S., Water quality, Hydrology, Meteorological data, Climatology, Water rights, Water management (Applied), Water utilization, Consumptive use, Streamflow, Flow rates, Discharge measurement, Runoff, Aquifers, Water yield, Chemical analysis, Topography, Hydrographs, Water temperature, Sediment transport, Sediment yield
Identifiers: *Water resources Index (Pacific Northwest).

This appendix, prepared under the auspices of the Pacific Northwest River Basins Commission, is one of a series of 16 making up the complete Columbia-North Pacific Region Framework Study on water and related lands. The water resources segment of the study is presented in two volumes as appendex V. Volume 1 includes subregions 1-6 (the eastern sections of the North Pacific region study), and volume 2 includes subregions 7-12 (the western sections of the region). The study consists primarily of summarization, analysis, and extension of existing data on water resources (both surface and groundwater) of the region. The base period selected is 1929-58. The discharges used throughout generally reflect 1970 or 1975 conditions of development; that is, the natural flows have been depleted and regulated for those anticipated levels of use. The quantity and quality of water available in each subregion is shown on graphs and in tables. Data on sediment and temperature also are included. Each subregion report also contains a general hydrologic description of the area; a fairly detailed description of the climate; and discussions of water use, stream management, and water rights. In addition, the Regional Summary includes sections covering technological advancements and areas of need for additional hydrologic data. (Woodard-USGS)

EFFECT OF WATERSHED CHARACTERISTICS ON THE TIME PARAMETERS OF RUNOFF HYDROGRAPHS,
Minnesota Univ., Minneapolis. Dept. of Agricultural Engineering.
Pinhas Golany.
PhD Thesis, August 1970. 201 p, 48 fig, 38 tab, 45 ref, 2 append. OWRR Project B-007-MINN (4).

Descriptors: *Rainfall-runoff relationships, *Hydrograph analysis, *Systems analysis, *Model studies, *Streamflow, Runoff, Watersheds (Basins), Equilibrium, Runoff forecasting, Flow rates, Channel morphology, Topography, Mathematical studies, Equations, Computer programs, Mathematical models, Routing, Unsteady flow.
Identifiers: *Watershed characteristics, *Streamflow equilibrium (Time).

Physical characteristics of small watersheds in southeastern Minnesota were used to develop a mathematical model for the study of the effect of watershed characteristics on the time required for the rate of runoff at the outlet of the watershed to become equal to the supply rate. A theoretical equation is compared with an empirical equation. This is defined as 'time to virtual equilibrium'. It was concluded that the time to virtual equilibrium of a watershed is best determined as a sum of two parameters. One is the time to virtual equilibrium of the watershed, including the overland flow. The second is the channel rise time, defined as the time elapsed from time to virtual equilibrium of the elementary watershed to time to virtual equilibrium of the watershed at the outlet. The channel rise time increases with the size of the watershed. The travel time can be used to determine the channel rise time since both time parameters are functions of the same physical characteristics of the watershed, namely, the drainage area, the channel length, roughness, slope and cross section geometry. MOUNTAIN RUNOFF AND ITS RELATION TO PRECIPITATION, GROUNDWATER, AND

RECHARGE TO THE CARBONATE AQ OF NITTANY VALLEY, PENNSYLVANI
Pennsylvania State Univ., University Park. Geology and Geophysics.
Leonard Franklin Konikow.
MS Thesis, Pennsylvania State University, for Research on Land and Water Resource 1969. 128 p, 27 fig, 5 tab, 26 ref, 3 append Project A-005-PA (1).

Descriptors: *Surface-groundwater relat *Karst, *Recharge, *Pennsylvania, C rocks, Aquifers, Rainfall-runoff relat Hydrogeology, Hydrology, Groundwate ment, Water balance, Hydrologic budget tion, Sinks.
Identifiers: Nittany Valley (Penn).

The relations between mountain runoff, p tion, and changes in groundwater storage culated for the Nittany Valley of Penn This required an estimate of gravity yield surements of groundwater stage. The gravity yield of the shale and sandstone fo beneath the ridges of Nittany and Tusse tains was found to average about 1.5%. Th yield of the colluvium, which covers much ridges, is about 6%. In the Pine Grove M the variation of gravity yield with time ridingly controlled by its relation to mean water stage because of the great diffe porosity between the colluvium and Mountain runoff from shale and sandsto was flashy, while Spring Creek in a carbo area showed comparatively small fluctu discharge. Mountain streams flowing thro may completely or partially sink upon cro carbonates. (Knapp-USGS)

EVIDENCE FOR A DEEP WESTERN B RY CURRENT IN THE SOUTH OCEAN,
Woods Hole Oceanographic Institution, M
B. A. Warren.
Supported by Office of Naval Research Physical Science, Vol 229, No 1, p 18-19 4, 1971. 2 p, 7 ref.

Descriptors: *Ocean currents, *Ocean ci *Indian Ocean, Boundaries (Surfaces), M dies, Salinity, Depth, Velocity, Density Flow, Currents (Water), Water ci Stratified flow.
Identifiers: *South Indian Ocean, *Ocea dary currents.

Simple models of the deep ocean circulat southern hemisphere require narrow, r flowing currents along the western bour the great ocean basins to transport cold, tarctic water into low latitudes. The dee maximum found throughout the southe sphere lies at depths of 2,000-3,000 m in Indian Ocean, well above our assumed lev meridional velocity. Because the salinity is formed through entrainment of North deep water in the circumpolar current, s must also enter the deep Indian Ocean south. The way in which this comes about tirely clear from the present two hydrogr tions. It happens that near Madagascar, a 2,000 m, the calculated values of r geostrophic velocity generally decrease w down to about the 3,000 m level, then again at great depth; the assumption velocity is zero at 3,000 m is then consis northward movement not only of the bott but also of the water of maximum (Woodard-USGS)

AN EXPERIMENT IN FINITE-DIFF WATERSHED MODELING,
Montana Univ., Boziman. Joint Water R Research Center.
Darrel E. Dunn.

Montana University Joint Water Resources Research Center Report No 13, July 1970, 14 p, 42 ref, 36 p computer program. OWRR Project A-034-MONT (2).

Descriptors: *Model studies, *Watersheds, *Simulation analysis, *Computers, *Testing, Hydrographs, Water storage, Vadose water, Groundwater, Statistical models, Data processing, Water resources.
Identifiers: *Phreatic zone, *Watershed simulation.

This report details an attempt to develop an accurate finite-difference watershed model. The watershed was simulated by dividing the watershed system into seven cells and then calculating water transport from cell to cell through successive time increases: surface runoff, vadose zone, water table, fluctuating phreatic zone, remainder of phreatic zone, and a cell layer on the bottom and on the top for computational convenience. Cells are formed by dividing each layer by a grid into three-dimensional parallel pipeds, and then weather data are added. From this setup, any type of water storage in the system can be calculated, as well as stream hydrographs. The model was tested by attempted simulation of the Bridger Creek Watershed near Bozeman, Montana. The model failed to simulate this watershed with accuracy, and the error was so great that further testing was not attempted. A fairly large amount of computer time was used on an XDS Sigma 7 computer. It was felt that a basic deficiency of this model is lack of a cell layer to represent the upper, more permeable part of the phreatic zone. The computer program is appended to the report. (Yensen-Arizona)

SIMULATION VIA TIME-PARTITIONED LINEAR PROGRAMMING: A GROUND AND SURFACE WATER ALLOCATION MODEL FOR THE GALLATIN VALLEY OF MONTANA,
Montana State Univ., Bozeman. Dept. of Agricultural Economics.
Donald William Boyd.
Ph d thesis. Montana University Joint Water Resources Research Center Report No 10, June 1968. 217 p, 7 fig, 10 tab, 3 append, bibliography. OWRR Project B-029 MONT (1).

Descriptors: *Model studies, *Water shortage, *Surface-groundwater relationships, *Montana, *Economics, Irrigation, Water supply, Water demand, Irrigation water, Saturated soils, Groundwater, Water table, Computer models, Streamflow, Water users, Water utilization, Recharge, Water distribution (Applied), Data collections, Streamflow forecasting, River flow.
Identifiers: *Gallatin Valley of Montana, Gallatin River of Montana.

The Gallatin Valley, Montana, usually has water shortage only at the peak irrigation season, complicated by a rising water table caused by irrigation at the lower end of the valley. This rising water table removes land from production. The area has vast potential groundwater reserves but interbasin transfer is impracticable. The author reviews the history of the water shortage, previous studies of the problem, and the need for a model. He then details how a model was selected and derived. The model was validated against 30-year records of streamflow, with a 20 per cent error observed. The model was judged accurate enough to simulate groundwater pumping, interbasin transfer, and recharge. Economic values were then calculated, and a value sensitivity analysis made to determine economic significance. The author concludes that the model realistically simulates the key features of the Gallatin Valley water system, including historical simulation, groundwater discharge, consumptive use, and optimal allocation. Groundwater development is the obvious solution to the water shortage and rising water table. Extensive appendices give yearly streamflow, precipitation, and groundwater data. (Yensen-Arizona)

MONTHLY PERSISTENCE PATTERNS OF AUCKLAND RAINFALL YIELDS,
Auckland Univ. (New Zealand). Dept. of Civil Engineering.
A. J. Raudkivi, and N. Lawgun.
Journal of Hydrology (New Zealand), Vol 9, No 1, p 29-31, 1970. 3 p, 2 tab, 2 ref.

Descriptors: Correlation analysis, *Rainfall, *Distribution patterns, Stochastic processes, Markov processes, Data collections, Meteorological data, Climatology.
Identifiers: *New Zealand.

A chi-square test was used to determine the persistence pattern of the monthly rainfall data obtained from Albert Park, Auckland, New Zealand. The results indicate the months for which the rainfall yields are affected by the amounts of rain of the immediately preceding month. Only three months of the year are affected by the immediately preceding month. These are March-April, July-August, November-December. It is interesting to note that the correlated pairs of months occur at equally spaced intervals, every 4 months. Thus by the serial correlation coefficient the persistence effect is insignificant, whereas the test indicates strong persistence effects between certain pairs of months of the year. This persistence pattern could be an important factor in some hydrological studies, for example in simulation of monthly rainfall data for water resources studies. (Knapp-USGS)
W71-05364

A GENETIC APPROACH TO CLIMATIC CLASSIFICATION,
Columbia Univ., New York. Dept. of Geography.
John E. Oliver.
Annals, Association of American Geographers, Vol 60, No 4, p 615-637, December 1970. 22 fig, 2 tab, 17 ref.

Descriptors: *Air masses, *Climatic zones, *Model studies, *Classification, *Synoptic analysis, Mapping, Arid lands, Seasonal, Precipitation (Atmospheric), Temperature, Humidity, Data collections, Climatic data, Meteorological data.
Identifiers: *Climatic classification, *Thermohyets, *Australia.

Because climatic systems have largely been approached as summations of annual temperature and precipitation values, a close, dynamic relationship between climate and related physical systems has never been clearly established. Once identified, an air mass can be interpreted in terms of temperature, humidity, stability characteristics and probable precipitation yield. A genetic approach to climatic classification was therefore devised using an air mass model whose transitional character is necessarily aligned to the transitional distribution of other natural systems, such as vegetative, pedogenic and geomorphic regimes. Set-theoretic diagrams were devised, representing 5 basic air mass designations, polar, tropical, equatorial, maritime and continental. Three basic climatic regimes are distinguished: (1) dominant, in which a single air mass dominates all year, (2) seasonal, in which 2 air masses are seasonally dominant (3) compound, which are influenced by more than 2 air masses during the year or in which no dominant air mass is distinguishable. A 3-directional matrix showing variations between dominant regimes suggests that compound regimes are transitions from one seasonal regime to another. A table is presented showing the determination of differing climates within regimes by air mass types. Air masses are differentiated on the basis of mean surface temperatures and specific humidity values. Monthly air mass dominance is determined by analysis of surface station data. Constructions of modified climographs, thermohygric diagrams and monthly air mass identification charts (MAMI) are described. Data from 90 Australian weather stations were used to test air mass differention using MAMI charts. Seasonally dominant air masses and their migrations were clearly shown. (Casey-Arizona)

THE NORTH AFRICAN FLOOD DISASTER, SEPTEMBER 1969,
Anti-Locust Research Centre, London (England).
D. Winstanley.
Weather, Vol 25, No 9, p 390-403, September 1970. 7 fig, 1 tab, 13 ref.

Descriptors: *Cyclones, *Precipitation (Atmospheric), *Fronts (Atmospheric), *Winds, Historic flood, Flood damage, Rainfall, Weather patterns, Weather data, Climatic data, Storm structure, Air circulation, Air masses, Air temperature, Boundary processes, Precipitation excess, Depression storage, Mountains, Impact (Rainfall), Synoptic analysis, Marine air masses, Floods, Thermocline, Atmosphere.
Identifiers: *North Africa, *Cyclogenesis, Desert Locusts, Mediterranean.

On 23 September, 1969, a cyclonic storm developed over the central Mediterranean, which moved westward over the next few days, across northwestern Libya and southern Tunisia, before finally dissipating over northeastern Tunisia. The resulting tolls in property and human lives were unprecedented. The accompanying rains even facilitated an unprecedented Desert Locust population explosion through the following winter and spring. Data from a great number of weather stations in the Mediterranean area were collected and analyzed for the factors involved in the genesis of the cyclone. The September monthly rainfall total at Biskra, Algeria, was 299.2 mm, compared to a previous record of 124.0 mm. A sequence of 1200 GMT surface charts indicate the main surface feature was the development of a Saharan depression over northern Algeria, which resulted from the anchoring of a lee depression by the Atlas mountains moving slowly northeastward until it was forced south by cool air. The Saharan depression finally moved out over the Mediterranean while other surface conditions which contribute to cyclone formation, were developing. Over northern Algeria and Morocco, the usual large temperature difference between the Mediterranean coast and the desert was enhanced by the orographic barrier. In addition to surface effects, and differential heating, flow is analyzed at different trophospheric levels, and cyclonic conditions are analyzed in terms of large-scale atmospheric flow patterns within which more local changes are taking place. CONVERGENCE ZONES IN SOUTHER CALIFORNIA,
Weather Bureau, Los Angeles, Calif.
J. H. Aldrich.
Weather, Vol 25, No 4, p 140-146, April 1970. 3 fig, 5 ref.

Descriptors: *Winds, *Climatic zones, *Sea breezes, *Air masses, *Fronts (Atmospheric), Air circulation, Air temperature, Atmosphere, Boundary processes, Air-water interfaces, Air environment, Environmental effects, Mode of action,

California, Arid lands, Climatology, Clouds, Humidity, Weather patterns, Wind pressure, Shear, Air pollution, Temperature, Precipitation (Atmospheric), Arizona, Wind velocity.
Identifiers: *Convergence zones, *Shear lines, *Wind shear, *Temperature inversions.

The lifting forces of the atmosphere which create soaring conditions for birds and gliders are created by forcing excess air upward. A shear line is a line or narrow zone across which there is an abrupt change in the horizontal wind velocity parallel to this line. Convergence involves an accumulation of air mass leading to vertical motion which limits the amount of excess air. A convergence line is a horizontal non-frontral line along which horizontal air has a maximum convergence. The best known form of shear line is that formed by a sea breeze. Solar heating and rising warm air over land create a convergent flow at the cooler sea breeze front, which usually produces lift and a shear line between the sea air and the land air. Passing storms, low-level temperature inversions and high mountains may all complicate this phenomenon. In Southern California a temperature inversion above the cool sea air and varied patterns of coastal hills and high mountain ranges produce very complex results. Some sea air does rise several thousand feet to flow through mountain passes into the desert. The San Fernando Convergence Zone, the Elsinore shear line, the El Mirage Shear over the Mojave Desert and the Tehachapi shear are all situations produced by factors complicating sea and mountain breezes. Another type of convergence zone occurs over the southwest U.S. when moisture-laden southeastern currents converge over Arizona with a drier flow from Southern California, creating abundant cumulus clouds and thunderstorms over the lower Colorado River Valley. (Casey-Arizona)

GLACIAL GEOLOGY OF THE CHAMPLAIN VALLEY: 1966-1970,
Vermont Univ., Burlington. Dept. of Geology.
W. Philip Wagner.
Available from NTIS as PB-197 882, $3.00 in paper copy, $0.95 in microfiche. Vermont University Water Resources Research Center Completion Report, February 1971. 11 p, 3 fig, 9 ref. OWRR Project A-006-VT (2).

Descriptors: *Hydrogeology, *Glacial drift, *Vermont, Lakes, Alluvium, Deltas, Sands, Gravels, Aquifers, Water yield, Geology, Water resources development, Paleohydrology, Sediments, Geohydrologic units
Identifiers: *Lake Champlain, *Champlain Valley (Vt).

Detailed study of the distribution of surficial materials in the Champlain Valley, Vermont, established a framework for the glacial history and provided basic information relevant to water supply, waste disposal, and sand and gravel resources. Postglacial modifications of the glaciated landscape include stream incision of up to several hundred feet, deposition of stream alluvium, and progressive submergence of southern portions of the Lake Champlain basin due to isostatic uplift of the spillway to the St. Lawrence River. High yield water supplies from surficial materials is limited to alluvium but quantities sufficient for domestic supplies are available in most places. Septic systems and sanitary landfills are probably most favorably accommodated by delta sands and gravels. Sand and gravel supplies are provided by ice marginal deposits and upland deltas. (Knapp-USGS)

SNOW SURVEY TECHNIQUES IN THE WAITAKI CATCHMENT, SOUTH CANTERBURY,
Ministry of Works, Timaru (New Zealand).
T. J. H. Chinn.
Journal of Hydrology (New Zealand), Vol 8, No 2, p 68-76, 1969. 9 p, 3 fig, 6 ref.

Descriptors: *Snow surveys, *Sampling, *Runoff forecasting, Glaciers, Snowpacks, Snow management, Precipitation gages, Water yield.
Identifiers: *New Zealand.

A brief outline is given of observations being made on seasonal snow at snow courses in the Waitaki catchment and the Tasman Glacier, New Zealand. Sampling difficulties are often caused by ice lmelting of ice layers also creates difficulties in interpreting summer samples. To overcome this problem without digging pits, a circular shaft, constructed of corrugated iron, was installed on the Tasman Glacier. This enables snow layers to be marked and sampled at any depth within the shaft. Loss of records has often occurred because sampling-site marker poles have been overtopped or broken by strong winds; poles consisting of lengths of PVC piping supported by one guy wire have been found partially successful in preventing this. STUDIES OF SNOW CHARACTERISTICS IN THE NORTH-EASTERN BEN OHAU MOUNTAINS, NEW ZEALAND,
Department of Scientific and Industrial Research, Lincoln (New Zealand). Grasslands Div.
A. C. Archer.
Journal of Hydrology (New Zealand), Vol 9, No 1, p 4-21, 1970. 18 p, 9 fig, 6 tab, 13 ref.

Descriptors: *Snowpacks, *Snow surveys, *Water yield, *Snowmelt, Regression analysis, Runoff forecasting, Ablation, Temperature, Regimen, Weather, Meteorology.
Identifiers: *New Zealand).

Seasonal snow characteristics were studied during the winter and spring of 1966 and 1967 in the subalpine and alpine zones of the northeastern Ben Ohau Range, New Zealand. Five snow courses were established at altitudes of 3,200 ft, 4,100 ft, 5,000 ft, and 5,400 ft. Snow depths, snow density and water equivalents were measured along each snow course. A positive linear regression was established of increasing water equivalents with altitude. Temperatures were also recorded 16 in. above ground surface at 3,200 ft, 4,100 ft, and 5,000 ft, and an index of snow melt was compiled at 5,000 ft from screen temperatures and ablation rates. Characteristic slow net accumulation and rapid ablation are discussed in relation to weather phenomena. (Knapp-USGS)

ESTIMATE OF GLACIERS SECULAR (1948-1966) VOLUMETRIC CHANGE AND ITS CONTRIBUTION TO THE DISCHARGE IN THE UPPER NORTH SASKATCHEWAN RIVER BASIN,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
W. F. S. Henoch.
Journal of Hydrology, Vol 12, No 2, p 145-160, January 1971. 16 p, 7 fig, 3 tab, 27 ref.

Descriptors: *Glaciers, *Ablation, *Regimen, *Water yield, Discharge (Water), Surveys, Data collections, Hydrologic data, Melting, Water storage, Climatology, Climatic data.
Identifiers: *North Saskatchewan River (Canada), *Glacier recession (Canada).

The recent trend of glacier recession in the Rocky Mountains began in the late 19th century. Since that time numerous studies of glaciers have been made but estimates of glacier volume decrease and the resultant increase in river discharge are lacking. Quantitative measurements show that glacier volume loss in the Upper North Saskatchewan River Basin during the period 1948-1966 was 1 cu km. This is approximately 4% of the total discharge determined from the records of the hydrometric stations at Saskatchewan Crossing and Mistaya River. (Knapp-USGS)

RHEOLOGICAL PROPERTIES AND BEARING CAPACITY OF FROZEN SOILS,
S. S. Vyalov.
Trans from Russian. Available from NTIS as AD-481 856, $3.00 in paper copy, $0.95 in microfiche. Cold Regions Research and Engineering Lab., Hanover, NH. Translation 74, Sept 1965. 219 p.
Identifiers: *Soil mechanics, Physical properties, *Soils, Cold weather tests, USSR, Loading (Mechanics), Deformation, Compressive properties, Plasticity, Failure (Mechanics), Fracture (Mechanics), Penetration, Buckling (Mechanics), Sand, Silt, Ice, Melting, Shear stresses, Water, Mud, Foundations (Structures), Permafrost, Stability, Arctic regions, Translations.

The rheological properties of frozen soil caused by the presence of ice and non-frozen water are important factors, without consideration of which calculations of the stability and steadiness of frozen soil are not possible. In the present work certain principles of rheology and the stability of frozen soil were examined, and proceeding from these principles an evaluation of the bearing capacity of natural footings and artificial pile foundations was made.

THE EFFECT OF ANTITRANSPIRANT MATERIALS ON THE RADIATION BALANCE AND EVAPORTANSPIRATION IN AN IRRIGATED ALFALFA FIELD, ADDENDUM TO FINAL REPORT,
Nebraska Univ., Lincoln. Dept. of Horticulture and Forestry.
Thomas A. Hales.
Horticulture Progress Report 83, December 1970. 180 p, 42 fig, 33 tab, 61 ref, 3 append. OWRR Project A-001-NEB (9).

Descriptors: *Evapotranspiration control, *Nebraska, *Alfalfa, *Chemcontrol, Water conservation, Water balance, Solar radiation, Irrigation, Water utilization, Consumptive use.
Identifiers: Atrazine, Antitranspirants.

A series of tests was carried out to test antitranspirants on 'Ranger' alfalfa in the Great Plains. Phenylmercuric acetate (PMA), Atrazine and Vatsol OT reduced transpiration but caused some foliar damage. Span 80 and Geon 652 reduced transpiration with no undesirable effects on plant growth. Replicated 3 m square plots were used to test various concentrations of PMA, Atrazine, Span 80 and Antifoamer A for effects on stomatal aperture, reflected solar radiation, net radiation, foliar production and soil moisture depletion. The PMA solutions increased leaf resistance as measured with a diffusion porometer. Neither PMA nor Antifoamer A affected net radiation, evapotranspiration, sensible heat flux or leaf temperature. Micrometeorological techniques used to measure the effectiveness of antitranspirant materials indicated no reduction in the evapotranspiration by field grown alfalfa at Mead, Nebraska. These experiments do not suggest any practical advantage to the use of antitranspirants on alfalfa in the central Great Plains. (Knapp-USGS)

sing a combination of a surface energy balance uation and an approximate expression of water por and sensible heat transfer, an equation is for-ulated relating potential evaporation for net diation, ambient air properties, and surface ughness. The proposed model contains no empir-al constants or functions. Tests of the model in noenix, Arizona, using open water, wet bare soil, d well watered alfalfa, show excellent agreement calculated and measured values on an hourly d daily basis under a variety of circumstances. st conditions typically included advection of sen-le heat to the evaporating surface in a large pro-rtion to the latent heat flux, as well as high values radiant flux, ambient temperatures, and vapor essure deficits. The use of daily average values r the weather variables in the model, rather than urly data, did not give appreciably different sults or conclusions on a series of mostly clear ys, suggesting that the combination model is not ly accurate but also practical and generally ap-icable. (Woodard-USGS)

entifiers: *Canada, *Ireland, *Potential evapora-n.

hen evaporation from the surfaces of a region is nited by the availability of moisture, the resultant anges in the temperature and humidity of the erpassing air are reflected in the potential aporation. Such interactions have provided the sis for the development of a model in which the gional evaporation, a product of climatic, soil isture and vegetative processes, is estimated m its effects on potential evaporation or on presentative climatological observations. The sults are tested with previously published drologic and climatologic data from 20 river tchments in Canada and Ireland. These tchments have a range in annual runoff of ap-oximately zero to one meter and a range of snow ver duration from almost zero to six months. mparison of model predictions with precipita-n less runoff estimates for five-year periods pro-les reasonable evidence for the validity of the del with a maximum deviation of 44 mm per yr, 9%, and a standard error of estimate of 26 mm r yr. Seasonal comparisons show the variability catchment storage and the effects of climate and pography on regional evaporation. (Knapp-SGS)

NET AND SOLAR RADIATION RELATIONS OVER IRRIGATED FIELD CROPS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
Leo J. Fritschen.
Agricultural Meteorology, Vol 4, p 55-62, 1967. 8 p, 1 tab, 12 ref.

Descriptors: *Evapotranspiration, *Solar radiation, *Soil moisture, *Irrigated land, *Field crops, Data collections, Statistical methods, Regression analysis, Equations, Albedo, Radiation, Alfalfa, Barley, Cotton, Oats, Wheat, Sorghum.
Identifiers: Standard errors.

A relation was sought between solar radiation and net radiation measured over irrigated field crops of alfalfa, barley, wheat, oats, cotton, and sorghum for estimating evapotranspiration from crop surfaces. Data collected under field conditions were analyzed by linear regression techniques. Standard deviation from regression was 0.02 ly/min for individual days and for individual crops. The regression equations changed from day to day; therefore, were of little value for estimation purposes. Seasonal data for individual crops were pooled and analyzed by linear regression. The resulting standard errors were about twice as large as those for individual days, ranging from 0.02 to 0.05 ly/min. When the data for all crops and all days were pooled and analyzed by linear regression, the resulting standard error was 0.06 ly/min. Thus, estimating net radiation for any of the crops from solar radiation would result in a standard error of 38 ly, or approximately 10%, for a 12-hour day having 649 ly incoming radiation. The regression equation may be solved using either hourly or daily solar radiation data. In the absence of net radiation data either the pooled regression or the individual crop regressions may provide sufficiently accurate estimates for some applications-for example, estimating evapotranspiration to be used in the design of irrigation projects. (Woodard-USGS)

WATER BALANCE IN LEAF TISSUE,
Ceskoslovenska Akademie Ved, Prague. Ustav Experimentalni Botaniky.
Jana Pospisilova.
Biologia Plantarum (Praha), Vol 11, No 2, p 119-129, 1969. 13 fig, 10 ref.

Descriptors: *Leaves, *Water balance, *Transpiration, *Absorption, *Water transfer, Plant physiology, Stomata, Laboratory tests, Humidity, Temperature, Gravimetry, Evaporation, Saturation, Time lag, Moisture stress, Plant tissues.
Identifiers: *Water potential, *Water saturation deficit.

The relative rates of water absorption and transpiration determine water balance in leaf tissue. A technique was developed for determining simultaneous water absorption and transpiration at various initial water saturation deficits (wsd) when these phenomena are occurring simultaneously in different parts of a leaf. A plexiglass chamber was built with 3 equal-sized compartments. A segment of leaf tissue could be separated by the compartments so that water could be absorbed on 1 side, transported through the middle compartment and transpirated on the other side. Leaves were subjected to 4 types of external conditions in which relative humidity and linear rate of airflow differed, creating varying water potential gradients between leaf and surrounding air. Water absorption, transpiration intensity and wsd were continuously monitored by gravimetric methods. Results indicated that high wsd are found in leaf tissue supplied with sufficient water from 1 side, even under conditions where evaporation and transpiration intensities were not extremely high. Comparing upper, middle and lower leaves and leaves from younger and older plants, it was found that upper leaves and leaves from younger plants showed the lowest water absorption/transpiration intensity ratios. Also, water transport was practically independent of vessel orientation in leaf tissue samples. Vessel incisisions resulted in considerable changes in water balance. (Casey-Arizona)

A STUDY OF THE MECHANISMS AND SUPPRESSION OF EVAPORATION OF WATER FROM SOILS,
Texas A and M Univ., College Station. Water Resources Inst.
C. W. Wendt.
Available from NTIS as PB-197 999, $3.00 in paper copy, $0.95 in microfiche. Texas Water Resources Institute, Texas A and M University, Technical Report 33, Feb 1971. 123 p, 25 tab, 38 fig, 13 ref. OWRR Project B-002-TEX (6).

Descriptors: *Evaporation, *Evaporation control, *Evapotranspiration, *Soil moisture, *Water conservation, Consumptive use, Irrigation.

Extensive greenhouse experiments were conducted to evaluate chemicals not previously studied extensively for their potential as evaporation suppressants. Included in the studies were crude oil, anionics, cationics, nonionics, silicones, polysaccharide-gum mixtures, oil-latex mixtures, fatty alcohols, and reflectance materials. Of these compounds, only crude oil and crude oil-cationic mixtures were effective in suppressing soil water evaporation significantly when applied to smooth Olton loam wet soil surfaces. This cationics apparently acted as a bond between the cation exchange capacity of the soil. In some cases the crude oil affected emergency of tomatoes and onions, but did not effect the emergence of cucumbers. The crude oil was most effective on smooth wet soil surfaces and least effective on rough dry surfaces. Crude oil-treated surfaces were effective against wind speeds up to 6.5 m/sec (15mph) for 3-4 days at rates as low as 946 l/ha (100 gal/acre). As soil temperature was increased from 10 deg C. to 38 deg C. crude oil-treated surfaces were less effective in suppressing evaporation due to the increased vapor pressure of the soil water. Varying the light intensity from 0.15 to 0.60 Langleys/min did not influence the evaporation from crude oil surfaces in the controlled environment chamber. Crude oil appears to be an effective evaporation suppressant when applied to a smooth wet soil surface. Further, it is most effective immediately after water applications when the soil water evaporation rate is the highest, and the most economical material reported to date ($3 - $18 per acre or $.06 a gallon).

A PROPOSED STREAMFLOW DATA PROGRAM FOR CENTRAL NEW ENGLAND,
Geological Survey, Boston, Mass.
Carl G. Johnson.
Geological Survey Open-file report, 1970. 38 p, 3 fig, 7 tab, 8 ref, append.

Descriptors: *Streamflow, *Hydrologic data, *Project planning, *New England, Evaluation, Data collections, Gaging stations, Time series analysis,

Water resources development, River basins, Watershed management, Flow characteristics, Channel morphology, Precipitation (Atmospheric), Topography, Regression analysis, Soils, Vegetation, Stream gages, Surface waters, Lakes, Elevation.
Identifiers: *Streamflow data evaluation (Central New England).

An evaluation of the streamflow data available in Central New England was made to provide guidelines for planning future programs. The basic steps in the evaluation procedure were (1) definition of the long-term goals of the streamflow data program in quantitative form, (2) examination and analysis of all available data to determine which goals have already been met, and (3) consideration of alternate programs and techniques to meet the remaining objectives. A summary table includes all streamflow stations now in operation and those to be established for the proposed program. Each station is identified as to type of data and recommendations are made as to whether the station should be included in the proposed network or whether it has met its objective and could be discontinued. Data collected at most current-purpose gaging stations may also be used for planning and design. (Woodard-USGS)

AN OPTIMUM WATER ALLOCATION MODEL BASED ON AN ANALYSIS FOR THE KISSIMMEE RIVER BASIN (PHASE I)-PROGRESS REPORT.
Florida Univ., Gainesville. Dept. of Agricultural Economics; and Central and Southern Florida Flood Control District, West Palm Beach.

Florida University Water Resources Research Center Report, December 1970. 27 p, 3 fig, 11 tab. OWRR Project B-005-FLA (2).

Descriptors: *Water resources development, *Model studies, *Florida, *Surface waters, *Water allocation (Policy), Irrigation, Percolation, Agriculture, Mathematical studies, Equations, Computer programs, Hydrologic data, Hydrologic cycle, Lakes, Streams, Reservoirs, Storage, Evaporation, Water utilization, Consumptive use, Test procedures, Methodology, Evaluation, Water demand.
Identifiers: *Kissimmee River basin (Fla).

This research, concerning the optimum allocation of water in Central and Southern Florida, uses the Kissimmee River Basin as a pilot study area. A dynamic linear programming model was developed to allocate the water among the alternative uses within the upper sub-watershed and between time periods within that sub-watershed. The year was divided into four time periods for the purpose of data collection and developing the programming model. The determination of the time periods was based on the amount of precipitation and the demand for supplemental irrigation. The four time periods were: (1) June, July, August and September, (2) October and November, (3) December and January, and (4) February, March, April and May. Data were collected for each time period to estimate the benefits (such as, agricultural and recreational) from water, the quantity of water available for allocation (such as rainfall, runoff and evaporation), the restrictions on the use of water, and stage-storage-damage relationships. These data were then applied to the dynamic linear programming model to determine the optimum allocation of water under present conditions. The programming model proved useful for determining the optimum allocation of water among different time periods within the sub-watershed. (Woodard-USGS)

FLOOD FREQUENCY IN ALASKA,
Geological Survey, Anchorage, Alaska.
Joseph M. Childers.
Geological Survey Alaska District Open-file report, 1970. 30 p, 3 fig, 3 tab, 5 ref, append.

Descriptors: *Floods, *Flood forecasting, *Alaska, *Hydrologic data, *Data collections, Streamflow, Gaging stations, Flow rates, Precipitation (Atmospheric), Geomorphology, Regional flood, Frequency, Flood plains, Hydrology, Maximum probable flood, Peak discharge, Runoff, Discharge measurement, Statistical methods.
Identifiers: Standard project flood, Intermediate regional flood.

Records of peak discharge at 183 sites were used to study flood frequency in Alaska. Peak stream discharges, where gaging-station records were available, were analyzed for 2, 5, 10, 25, and 50-year average-recurrence intervals. A regional analysis of the flood characteristics by multiple-regression methods gave a set of equations that can be used to estimate floods of selected recurrence intervals up to 50 years for any site on any stream in Alaska. The equations relate floods to drainage-basin characteristics. In Alaska the 50-year flood can be estimated from 10-year gaging station records with a standard error of 22 percent whereas the 50-year flood can be estimated from the regression equation with a standard error of 53 percent. Also, maximum known floods at more than 500 gaging stations and miscellaneous sites in Alaska were related to drainage-area size. An envelope curve of 500 cubic feet per second per square mile covered all but 2 floods in the State. (Woodard-USGS)

A PROPOSED STREAMFLOW DATA PROGRAM FOR MISSISSIPPI,
Geological Survey, Jackson, Miss.
James D. Shell, and Fred H. Thomson.
Geological Survey Open-file Report, 1970. 48 p, 5 fig, 10 tab.

Descriptors: *Streamflow, *Hydrologic data, *Project planning, *Mississippi, Data collections, Gaging stations, Evaluation, Time series analysis, River basins, Network design, Data processing, Regression analysis, Watershed management.
Identifiers: Current purpose data.

An evaluation is made of available streamflow data in Mississippi to provide guidelines for planning future hydrologic data collection programs. The evaluation is in three basic steps; definition of the long-term goals of the streamflow data program in quantitative form, examination and analysis of available data to determine goals achieved, and development of proposals of ways to meet the remaining goals. General objective of the data collection program is to be able to furnish necessary estimates of streamflow characteristics for any site on any stream in the State, with specific accurac goals. It was found that several of these goals coul be met by generalization of the data from gage basins by regression analysis. This allows significar changes to be made in the present collectio system that will permit emphasis to be placed on a taining unmet goals. A network design is presente for implementing the proposed streamflow dat program to meet future needs. (Lang-USGS)

BIG BLUE RIVER BASIN APPENDIX.
Nebraska Soil and Water Conservation Commis sion, Lincoln.

Nebraska Soil and Water Conservation Commis sion State Water Plan Publication No 201A, Sep tember 1968. 144 p, 3 fig, 35 tab, 6 ref, 7 plate.

Descriptors: *Water resources developmen *Groundwater, *Surface waters, *Nebraska, Irriga tion water, Recreation, Flood control, Erosion con trol, Reservoirs, Planning, Hydrogeology, Hydrolo gy, Geology, Hydrologic data, Water quality Water utilization.
Identifiers: *Big Blue River Basin (Nebraska).

This appendix presents information and data con cerning water resources development in the Bi Blue River Basin in Nebraska under six sections a follows: Flood Control; Water Quality; Irrigatio Water Management; Fish and Wildlife; Geolog and Groundwater; and Water Utilization. Flood have occurred in 35 of the 64 years of recor (1902-1965). Current efforts involve analysis o the flood problems. Suspended sediment is th most important pollutant in the Big Blue River Crop irrigation is a consumptive and a necessar use of water in Nebraska. The supply of outdoo

ation resources is critically short. Public areas nated for outdoor recreation include only percent of the total land area. Groundwater ge reservoirs are quite extensive in the upper central parts of the basin. The groundwater is currently declining in localized areas of concentration of irrigation wells. The water for municipal and industrial purposes is at nt being supplied entirely from groundwater es. Plans for water resources development ontrol are discussed. (See also W70-04603) odard-USGS)

Descriptors: *Hydrograph analysis, *Unit hydrographs, *Floods, *Flood forecasting, *Rainfall-runoff relationships, Rainfall, Runoff forecasting, Infiltration, Soil moisture, Surface runoff, Duration curves, Depth-area-duration analysis, Clays, Permeability.
Identifiers: River Ter (England).

The unit hydrograph method is applied to the analysis of the flood hydrology of the River Ter, a stream draining a clay catchment in Eastern England. Two distinct types of simple flood hydrograph resulting from storm rainfall are identified, one characteristic of winter runoff, and a shorter duration type occurring only during the summer. Most of the major floods result from longer and more complex rain periods producing flood hydrographs which may be interpreted as coalescent or superimposed hydrographs of one of the two simple types. The seasonal variation in simple hydrograph form is interpreted as the result of runoff normally occurring from only part of the catchment during the summer months. This is probably due to areal variations in the nature of seasonal changes in soil moisture conditions and crop cover. (Knapp-USGS)

Water Resources Research, Vol 7, No 1, p 52-62, February 1971. 11 p, 1 fig, 5 tab, 6 ref. OWRR Project B-061-CAL (6).

Descriptors: *Simulation analysis, *Droughts, *Streamflow, *Statistical methods, *Synthesis, Computers, Time, Cost, Reservoir design, River flow, Monthly.
Identifiers: *Critical periods, *Generating techniques, *Historical periods.

A set of monthly streamflow records was generated and analyzed to give a set of synthetic critical periods. The three characteristics used to compare the historical periods and the generated periods in relation to long-term yearly mean streamflow were: (1) minimum permissible constant extraction per year; (2) deficiency in streamflow accumulated during the critical period; and (3) duration of the critical period in months. Their respective means and standard deviations were used in computing values for the mean of the values of the three characteristics. All steps included in the analytical and synthetic sections of the generating techniques studied were shown and 10 generating techniques were described in detail. Twenty-six rivers were used therefore for each of the three critical period characteristics and four active storage capacities computed, a set of 26 mean values was obtained for each of the 10 generating techniques utilized. A study of the results allowed a comparison between the generating techniques in regard to both their computer time cost and their ability to synthesize critical droughts comparable to those recorded historically. Results were influenced by relative aridity of the watershed and by reservoir size. (Kriss-Cornell)

SUMMARY OF GROUNDWATER HYDROLOGICAL DATA IN MICHIGAN FOR 1969,
Geological Survey, Lansing, Mich.
P. R. Giroux, and G. C. Huffman.
Geological Survey Data Report, 1970. 101 p, 43 fig, 2 tab, 92 ref.

Descriptors: *Hydrologic data, *Groundwater, *Water wells, *Michigan, Water levels, Data collections, Aquifers, Hydrographs, Water level fluctuations, Water table, Water supply, Withdrawal, Water treatment, Water utilization.
Identifiers: *Groundwater inventory (Michigan).

Records of groundwater levels in the principal aquifers of Michigan through 1969 are tabulated. Other related information including records of groundwater pumpage; data on municipal, public, and industrial water-supply facilities; and the effects of precipitation on groundwater levels are presented. Records of water levels in areas of heavy pumpage, and in areas where changes are principally from natural influences, are illustrated or tabulated to allow comparison between these types of water-level fluctuations. The water levels and related data provide a day-to-day record for the evaluation of available groundwater supplies. The long-term records serve as a framework to which short-term records may be related. During the first half of 1969, water levels in most wells continued the rising trend of the past several years. However, stages fell during the latter part of the year and were lower than at the end of 1968. During 1969, record-high levels were observed in 90 wells and record lows in 28. Most of the record lows occurred in heavily pumped areas, or at stations having only 2to 3 years of record. (Woodard-USGS)

Descriptors: *Groundwater movement, *Waves (Water), *Unsteady flow, *Mathematical models,

Drawdown, Hydraulic models, Mathematical studies, Seepage, Water levels.
Identifiers: Shallow-water wave theory.

Shallow-water wave theory can be used to describe unsteady flow through porous media. The significant point of difference between this application and more usual ones is the much greater friction losses experienced by a fluid when moving through such media. The solution involves the integration of a pair of quasilinear hyperbolic partial differential equations. A modification of the method of characteristics programmed for a digital computer was the technique chosen. Good agreement between theoretical and experimental values was obtained. Because the single-well problem is symmetrical, a 15 deg sector only was investigated. A tank was buil5 deg sector of a 12 ft dia circle. It was instrumented and provided with facilities for generating specific boundary conditions. Depth gages which fed their output to a recorder continuously measured depths along a radial line in the tank. The porous medium chosen consisted of 5/8-inch crushed stone. Results were inaccurate close to the well where the groundwater surface was strongly curved. (Knapp-USGS)

GROUNDWATER RESOURCES IN THE EASTERN OSWEGO RIVER BASIN, NEW YORK,
Geological Survey, Albany, N.Y.
I. H. Kantrowitz.
New York Water Resources Commission Basin Planning Report ORB-2, 1970. 129 p, 44 fig, 6 plate, 11 tab, 25 ref.

Descriptors: *Water resources development, *New York, *Aquifers, Groundwater, Withdrawal, Water quality, Water wells, Water supply, Saline water, Water chemistry, Data collections, Hydrologic data, Hydrogeology, Glacial drift.
Identifiers: *Oswego River basin (NY).

The Eastern Oswego River basin includes approximately 2,500 square miles in central New York. About 35% of the 600,000 people in the basin rely on groundwater supplies. Groundwater sufficient for domestic supplies can generally be obtained. Sources of large supplies, such as for industries or municipalities, are present but not widespread. The principal aquifers in the basin are unconsolidated deposits of sorted and stratified sand and gravel. The most prolific sand and gravel aquifers are those that are hyy connected to streams or rivers. The total potential yield of 16 such aquifers is about 280 mgd. Currently, less than 5 mgd is being withdrawn. Two bedrock units, the limestone and middle shale units, are capable of yielding large quantities of water. Groundwater in much of the Eastern Oswego River basin is of poor quality. Large parts of the basin are underlain by relatively shallow salty groundwater. A total of about 21 mgd is withdrawn from all aquifers of the area for public, domestic, industrial, and commercial supplies. This is only 2% of the estimated natural groundwater recharge of 1,000 mgd. (Knapp-USGS)

GROUNDWATER IN PENNSYLVANIA,
Geological Survey, Harrisburg, Pa.
A. E. Becher.
Available from Bureau of Publications, Tenth and Market Streets, Harrisburg, Penn 17125. Pennsylvania Geologic Survey Educational Series No 3, 1970. 42 p, 29 fig, 1 map, 2 tab, 46 ref.

Descriptors: *Water resources, *Groundwater, *Pennsylvania, *Hydrogeology, Water resources development, Evaluation, Geology, Aquifers, Aquifer characteristics, Precipitation (Atmospheric), Surface waters, Streamflow, Runoff, Meteorology, Evapotranspiration, Water yield, Specific capacity, Water table, Hydrologic data, Water utilization, Consumptive use, Water pollution, Water pollution sources, Water quality, Water rights, Planning.

The existing knowledge of the groundwater resources of Pennsylvania is summarized. It was written to provide industrial and civil planners, developers, managers, and the public with sufficient information about statewide water resources to make intelligent, fundamental decisions about the future use, development, and protection of the groundwater. Pennsylvanians used about 6.6 BGD (billion gallons per day) of water in 1966, excluding electric power plant use. Although only 11% of the water was taken directly from groundwater sources, 25 to 35% of the people depend on groundwater for their personal needs. In addition, 55% of water companies obtain all their water, and another 13% obtain part of their water, from groundwater sources. Twenty-one of the 67 Pennsylvania counties obtain more than half their total water supplies from groundwater. Both regional and local problems of water quality exist in Pennsylvania. Many of these problems are the result of activities undertaken in the past without adequately protecting water resources. Waters that flow from coal mines and contain high concentrations of sulfuric acid and iron in solution are the major problem of water quality both in the volume of water involved and the total area affected. Second to acid mine waters in areal extent, but equally serious, is the pollution of Pennsylvania's stream and groundwaters by sewage and industrial wastes. Another type of groundwater pollution is caused by crude oil and saline waters moving upward into fresh water aquifers either through natural openings or through oil and gas wells abandoned prior to the well plugging law of 1951. G. V. Bogomolov, and O. N. Shpakov.
Doklady Akademii nauk BSSR, Vol 4, No 4, p 348-350, 1970. 1 tab, 8 ref.

Descriptors: *Groundwater, *Hydrostatic pressure, *Hydrogeology, Wells, Chlorine.
Identifiers: Belorussia.

Belorussian upland, the most ancient formation of the European plain of Russia, is under hydrostatic pressure of the Pripiyat, Baltic, and Moscow depressions. The composition of groundwater is closely related to the geologic history of these territories, their submergence under the sea water and subsequent formation of calcareous, quartzite-glauconitic, and chalk sediments. High chlorine content in fresh subterranean waters is attributed to the buried, metamorphized water of the former sea basins. The water samples with high content of chlorine were obtained predominantly from well points located near tectonic deformations and within the local drainage areas. (Wilde-Wisconsin)

GROUNDWATER RESERVOIR RESPONSE EARTH TIDES,
Virginia Polytechnic Inst., Blacksburg. Dep Geophysics.
Edwin S. Robinson.
In: Virginia Polytechnic Institute and State Un sity Water Resources Research Center Bulleti p 55-65, December 1970. 11 p, 2 tab, 8 ref. O Project A-023-VA (1).

Descriptors: *Water level fluctuations, *Gro water, *Water wells, Tidal effects, Vir Aquifers, Porosity, Storage coefficient, Perme ty, Confined water.
Identifiers: *Earth tides.

A study was undertaken in Virginia to exa tidal water level fluctuations in wells, and to d titatively relate observed tides and groundw reservoir storage parameters. Data from wells were examined, and tides were identifi twelve of these wells. The tides observed in wells can be related to the porosity and bulk m lus of an aquifer by means of the equa presented. To establish this relationship one have water level records, barometric records ocean tide records covering at least two week preferably 29 continuous days. (See also 05555) (Knapp-USGS)

tifiers: Salisbury (Md).

Salisbury, Maryland, water resources in-
gation afforded the opportunity for a detailed
rface study of the Pleistocene Series beneath
-square-mile area surrounding the city. Twen-
ur core holes and 15 test holes were drilled.
these new data emerged a clarification of the
graphic sequence. North of Salisbury a deep
tocene paleochannel was discovered. Filling in
overlying this paleochannel is the 'red gravelly'
s of the Salisbury Formation, a fluvial sand
sited by an aggrading river during a period of
base-level conditions, possibly coincident
the Sangamon Interglaciation. The estuarine
valent of the 'red gravelly' facies is the Beaver-
facies, a gray-white, fine to coarse-grained
. The 'red gravelly' facies is thickest north and
of Salisbury; it wedges out easterly toward
nsburg and southerly toward Princess Anne.
plementing this is an easterly and southerly
ening of the Beaverdam facies. Overlying the
bury Formation is the Walston Formation, an
sively developed fine-grained sediment. The
nsburg Sand, a coastal dune deposit, overlies
Walston Formation in the divide area. The
graphic relationship between the Parsonsburg
and the Walston Formation reflects the trans-
ive advance of dune sand over a surrounding
marsh facies. By the end of late Wisconsin
the present-day drainage network was incised
the terrane. As sea level rose during the sub-
ent Holocene marine transgression, interca-
fluvial gravels and marsh muds were
sited in and adjacent to present-day rivers. (K-

Typescript, 1970. 8 p.

Descriptors: *Pumping testing, *Performance, *Groundwater, Thiems equation, Theis equations, Transmissability, Water wells, Observation wells.
Identifiers: *Jacob method, *Pizometer, Orifice meters.

Obtaining reliable data which are amendable to mathematical analysis is one of the purposes of a pumping test. Such data are usually obtained by pumping one well continuously, and at constant rate, while making periodic measurements on water level changes in nearby observation wells. A relatively simple task at first glance, but no one can be sure the data can be analyzed with available techniques. Present equilibrium and non-equilibrium methods of analysis make the classic four basic assumptions. These assumptions, however, are not factors which the field man can adjust for in setting up his test. The analyst while also not being able to adjust for them can attribute departures of the data to departures of the aquifer from the ideal. Other classic assumptions are discussed which can be met by proper field design. (Campbell-NWWA)

Identifiers: *Topographic maps, *Geologic column, Rock unit correlation, Geologic cross-section construction, Record keeping, Aquifer test methods, Groundwater contamination.

The objective of this book is to present the basic geologic factors which control the occurrence, availability, and quality of groundwater. In an introductory treatment of this material the author believes it is more important to consider the principles of geology as they relate to the discovery and exploitation of groundwater rather than to develop the quantitative aspects of groundwater hydrology. Groundwater occurs in a geologica framework and unless the nature of the framework is understood an analysis of equations or computing procedures for developing various types of aquifers is of little use. Furthemore, this text is designed primarily for the water well drilling contractor who has had no formal training in geology, but it is also applicable to the general public. The author's treatment of groundwater hydrology and geology emphasizes the Eastern United States. (Campbell-NWWA)

2G. Water in Soils

THE PREDICTION OF UNSATURATED FLOW RATES FROM PHYSICAL PROPERTIES OF THE POROUS MEDIUM,
Oregon State Univ., Corvallis. Dept. of Soils.
Larry L. Boersma.
Available from NTIS as PB-197 880, $3.00 in paper copy, $0.95 in microfiche. Oregon State University Water Resources Research Institute Project Completion Report, December 31, 1970. 15 p, 7 fig, 7 ref. OWRR Project B-001-ORE (8).

Descriptors: *Soil water movement, *Unsaturated flow, *Permeability, *Porous media, Forecasting, Model studies, Equations, Porosity, Pervious soils, Soil properties, Pore pressure, Methodology, Gamma rays, Test procedures.
Identifiers: Mercury intrusion porosimeter, Pore size, Soil water characteristic curve.

The only methods which make it possible to obtain water transmission coefficients of porous media without the use of complicated experimental techniques are prediction methods based on physical properties of the medium. Simple laboratory techniques were developed to measure the physical properties needed in these prediction methods and to check these methods through a series of systematic measurements. Pore size distributions were determined by the mercury intrusion method. The mercury intrusion porosimeter is an instrument by which pressure can be applied to a reservoir of mercury in contact with a porous solid sample. Precise measurement of changes in the volume of mercury as the pressure is increased provides a measure of the volume of pores in a given size range. The permeabilities of the materials were measured with a constant head permeameter. Bulk densities and porosities were obtained with gamma ray attenuation equipment. A total of 63 samples was tested with permeabilities ranging from 1.5-39.1 square microns. The permeability of the inert porous materials considered can be predicted reliably when the pore size distribution is known. Mercury intrusion is an efficient and highly reproducible method to obtain the pore size distribution of soils. Mercury intrusion data can be used to provide the quantitative information required in transport models for water, heat and chemicals in porous media. (Woodard-USGS)

MOISTURE CHARACTERISTICS OF PENNSYLVANIA SOILS: III. PARENT MATERIAL AND DRAINAGE RELATIONSHIPS,
Pennsylvania State Univ., University Park. Dept. of Soil Genesis and Morphology.
G. W. Petersen, R. L. Cunningham, and R. P. Matelski.
Soil Science Society of America Proceedings, Vol 35, No 1, p 115-119, January-February 1971. 5 p, 5 fig, 3 tab, 17 ref.

Descriptors: *Soil moisture, *Soil-water-plant relationships, *Moisture content, Soil texture, Provenance, Soil types, Soil horizons, Soil physical properties, Porosity, Permeability, Soil formation.
Identifiers: Available moisture (Soil).

Available moisture (Wa), assumed to be the difference between moisture contents of 'undisturbed cores' equilibrated at 1/3 atm of tension and of sieved samples equilibrated at 15 atm of tension, was determined on samples collected from 207 profiles in 27 Pennsylvania counties. Weighted means of Wa, coarse fragments, sand, silt, and clay were calculated from A, B, and C horizons and for 0-30, 30-60, 60-90, and 90-120-cm depth increments for each soil profile, grouped according to parent material and drainage class. Parent material groups showed the following decreasing relative amounts of cumulative Wa: aeolian, alluvium, limestone, till, shale, sandstone, glacial-fluvial. Differences in Wa are related to textural relationships and course fragment contents, with Wa decreasing with increasing amounts of clay, sand, and coarse fragments. Wa generally decreased with increasing depth within each parent material group. Differences in the drainage were usually related to the parent material from which the soil developed. Therefore, differences in parent material should be the primary consideration when estimating Wa, and the effect of drainage conditions upon Wa should only be considered when these differences occur within a parent material group. A CAPILLARY PERTURBATION STUDY OF TWO-PHASE FLOW INFILTRATION,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Alain G. Noblanc.
M. Sc. Thesis, November 1970. 64 p, 21 fig, 3 ref. OWRR Project B-033-Colo (3).

Descriptors: *Infiltration, *Unsaturated flow, *Soil water movement, *Model studies, *Capillary action, Water, Air, Darcy's law, Equations, Soil water, Porosity, Porous media, Saturation, Permeability, Flow characteristics, Mathematical models, Numerical analysis.
Identifiers: Buckley-Leverett equations.

This study presents an analytical treatment of unidimensional flow of two immiscible fluids, water and air, into a porous medium. From the principle of continuity and Darcy's law applied to both fluids, a second order partial differential equation is derived in terms of water saturation, time and depth into the medium. In this differential equation the effect of capillarity is represented by a perturbation term. Even though the equation is solved approximately, the effect of capillarity is not neglected. The knowledge of an approximate saturation profile leads to the determination of the rate of water infiltration by a new combination of Darcy's law and principle of continuity. A numerical solution was found for a fine sand, semi-infinite porous medium with several different boundary and initial conditions. Infiltration curves and saturation profiles are presented. Identifiers: *Stone pavements, *Atacama Desert, *Deflation, *Mojave Desert.

Stone pavements are defined as armored surfaces comprising intricate mosaics of coarse particles, usually only 1 or 2 stones thick, that are set in deposits of sand, silt or clay. They occur widely, but most often in hot, little-vegetated deserts. Their formation has long been thought due to deflation, which is wind surface action causing the removal of lighter particles, leaving the heavier pebbles behind, which protect the underlying fine materials. It is argued that, in geomorphology, diverse processes working in differing areas from differing initial conditions often produce similar final forms, and that single process explanations are usually naive. Pavement studies were therefore carried out in several deserts, concentrating mostly on the Mojave and Atacama. The resulting data were then used to construct likely alternative modes of pavement formation: (1) wash and creep processes (2) upward particular migration (through freezing and thawing cycles, saturation and desiccation cycles and alternate salt solution and recrystallization) (3) insolation weathering (4) frost weathering (5) salt weathering (6) chemical processes and (7) superficial disintegration processes. Each process is described. It is felt that deflation may be relatively unimportant and that running water and upward imgration processes abetted by superficial disintegration are probably quite important. It seems certain that pavement areas differ greatly in their ages, history and formation processes. (Casey-Arizona)

PSYCHROMETRIC MEASUREMENT OF SOIL WATER POTENTIAL: TEMPERATURE AND BULK DENSITY EFFECTS,
Washington State Univ., Pullman. Dept. of Soil Science.
G. S. Campbell, and Walter H. Gardner.
Soil Science Society of America Proceedings, Vol 35, No 1, p 8-12, January-February 1971. 5 p, 4 fig, 1 tab, 17 ref. USAEC Project AT (45-1)-1543, Project W-68.

Descriptors: *Chemical potential, *Bulk density, *Temperature, *Vapor pressure, Soil texture, Soil physical properties, Soil water movement, Humidity, Water temperature.
Identifiers: Water potential, Psychrometers, Matric potential.

Changes in soil water potential with temperature were determined using thermocouple psychrometers on samples of four soils. Change in soil water potential with temperature becomes greater as soils become drier. The finer textured soils showed a greater change in water potential with temperature than did coarser soils at similar water potentials. Water potential change with bulk density also was determined for samples of three soils. Little change was noted except on a clay subsoil sample. In most cases negligible differences will arise from measuring water potential at laboratory temperature rather than at the temperature existing in the field and from use of disturbed field samples with altered bulk density rather than undisturbed field soil. However, at water potentials below about -20 bars, temperature effects may become significant, especially in fine textured soils, and measurements on clay subsoils may be significantly affected by changes in bulk density. *Chemical potential, *Instrumentation, Po
media, Mathematical models, Moisture me
Soil moisture meters, Calibrations, Moisture
tent, Bouyoucos blocks.
Identifiers: *Matric potential sensor.

matric potential sensor measures heat dissipation sense the water content of a porous block in uilibrium with soil. It consists of a P-N junction ode that is surrounded by a heating coil and embedded in a porous medium. A theoretical model scribes the sensor in terms of its limiting parameers. Geometry, size, rate of heat input, and duran of heating are chosen to obtain a desired gree of accuracy and to make the measurements lependent of the surrounding soil. Construction, ibration, measurement, and temperature corction techniques are described. Since the electri- output of the sensor is linear with temperature, ingle calibration curve is adequate at all temratures within the accuracy reported. By varying composition of the porous body, the range and sitivity of the sensor can be altered. (Knapp-GS)

criptors: *Hydraulic conductivity, *Soil water vement, Model studies, Laboratory tests, Unrated flow, Infiltration, Computer programs, hematical models, Moisture content.
ntifiers: Hydraulic conductivity calculation.

computational method based on the pore-inction model of Marshall was shown to compare orably with modified methods of Millington and rk and of Marshall for prediction of hydraulic ductivity vs. water content on a number of soils a glass bead system. All methods required ching one point on the calculated hydraulic ductivity curve to an experimentally measured raulic conductivity value. The calculation hods adequately predicted the experimentally sured values and provide satisfactory conductivity data for many applications. An advantage of the proposed method is its independence of the value chosen for the exponent on the porosity term in the prediction equation. (Knapp-USGS)

MOISTURE RETENTION OF CULTIVATED AND PASTURED MOLLISOLS AND ALFISOLS,
Agricultural Research Service, Beltsville, Md. Hydrograph Lab.
C. B. England.
Soil Science Society of America Proceedings, Vol 35, No 1, p 147-149, January-February 1971. 3 p, 3 fig, 1 tab.

Descriptors: *Soil structure, *Moisture content, *Soil-water-plant relationships, *Cultivation, Mathematical models, Land use, Data collections.
Identifiers: *Moisture retention.

Comparison of surface soil mositure characteristic curves for Mollisols and Alfisols under pasture and row-crop cultivation revealed that below 1/3 bar suctions cultivated Mollisols retained 40% more water and cultivated Alfisols retained 25% more than corresponding pastured soils. At tensions above 1/3 bar, cultivated soils of both orders held less water. (Knapp-USGS)

EFFECT OF TRICKLE IRRIGATION INTERVALS ON DISTRIBUTION AND UTILIZATION OF SOIL MOISTURE IN A VINEYARD,
Hebrew Univ., Jerusalem (Israel). Dept. of Irrigation; and Ministry of Agriculture, Rehovoth (Israel).
S. D. Goldbert, M. Rinot, and N. Karu.
Soil Science Society of America Proceedings, Vol 35, No 1, p 127-130, January-February 1971. 4 p, 4 fig, 2 tab, 9 ref.

Descriptors: *Irrigation effects, *Soil chemical properties, *Soil water movement, *Crop response, *Leaching, Moisture content, Water utilization, Consumptive use, Irrigation design, Soil-water-plant relationships.
Identifiers: *Trickle irrigation.

In an established vineyard on sandy clay soil the effect of trickle irrigation interval on soil moisture and salt distribution and relative water use efficiency was examined. The distribution of soil moisture and salinity resulting from this irrigation method is two dimensional, with moisture contents high along and beneath the row and decreasing laterally. The main active soil layer supplying water to the roots was found to be restricted to a strip approximately 2 m wide and 120 cm deep beneath the rows, whereas the total distance between rows was 3 m. The effect of shorter irrigation intervals, with proportionally smaller amounts of water applied in a single irrigation, was to decrease the variations of moisture content in the root zone and establish a continuously higher moisture regime. Salts were concentrated in a surface pocket and a deep layer with a leached zone between them. The relative position of the concentration layers was determined by the amount of water applied in a single irrigation. Relative water use efficiency was positively affected by shorter irrigation intervals both in terms of grape production and weight of prunings. (Knapp-USGS)

NUMERICAL ANALYSIS OF SOIL-MOISTURE SYSTEMS,
Drexel Univ., Philadelphia, Pa. Dept. of Civil Engineering and Mechanics.
Irwin Remson, A. Alexander Fungaroli, and George M. Hornberger.
ASCE Proceedings, Journal of the Irrigation and Drainage Division, Vol 93, No IR3, p 153-166, September 1967. 14 p, 9 fig, 2 tab, 12 ref, append.
NSF Grant GK-635.

Descriptors: *Soil moisture, *Unsaturated flow, *Numerical analysis, *Mathematical models, Evaporation, Hysteresis, Infiltration, Hydrogeology, Soil water movement.
Identifiers: Soil moisture analysis.

Soil-moisture systems are analyzed using a numerical technique and a digital computer. The technique is applicable to unsteady-flow systems in nonhomogeneous soils. Variable initial and boundary conditions may be considered. Nonlinear multivalued relationships between matrix moisture content, capillary potential, and hydraulic conductivity may be incorporated. The method is applicable in theory to one-, two-, or three-dimensional systems. A one-dimensional unsteady-flow system was analyzed and used to study the effects of evaporation and soil-moisture hysteresis on a draining mass of infiltrated rainfall. (Knapp-USGS)

TILLAGE SYSTEM EFFECTS ON WATER USE EFFICIENCY,
Virginia Polytechnic Inst., Blacksburg. Dept. of Agricultural Engineering.
V. O. Shanholtz, and J. H. Lillard.
Journal of Soil and Water Conservation, Vol 24, No 5, p 186-189, Sept-Oct 1969. 5 fig, 4 tab, 6 ref.
OWRR Project A-018-VA (4).

Descriptors: *Water utilization efficiency, *Soil-water-plant relationships, *Evaporation control, Water conservation, ZEA Mays, Soil water, Soil temperature, Surface runoff, Plant growth.
Identifiers: *No tillage, *Conventional tillage, Corn plant growth.

A hydraulic performance of two radically different row crop tillage systems, conventional tillage and no tillage was studied in 1966, 1967, and 1968. A randomized complete block statistical design was used to evaluate differences in the two systems. The greatest difference in total available soil water always occurred at planting date and progressively decreased during the growing season. No significant differences at the 5% level could be detected below 24 inches. Superior growth and yields were observed on the no tillage system, which resulted in more efficient utilization of available water. The advantages are attributed to the significantly less surface runoff, evaporation, and to the generally more favorable physical root zone environment for superior plant development which this system provides.

BAIKAL ARTESIAN WATERSHED, (IN RUSSIAN),
Nauchno-Issledovatelskaya Laboratoriya Geologii Zarubezhnykh Stran, Moscow (USSR).
N. A. Marinov.
Doklady Akademii nauk SSSR, Vol 191, No 4, p 897-900. 1 fig, 4 ref.

Descriptors: *Lakes, *Geomorphology, *Watersheds (Basins), Geothermal studies, Temperature, Hydrostatic pressure, Water properties.
Identifiers: *Lake Baikal (USSR).

A detailed description is given of the very complex geological features of the Baikal watershed formed by recent tectonic deformations that imparted to Lake Baikal its maximum depth of 1620 m over a 5 km deep crystalline foundation. The outstanding peculiarity of this geomorphological area is the presence of a 2500 m deep sheet of fresh subterranean water. The depressions of the watershed exhibit an augmented geothermal regime with water as the depth of about 2000 m attaining temperature from 75 to 90C. The deep layers of water are enriched in hydrogen, methane, heavy hydrocarbons, hydrogen sulfied, and carbon dioxide. The high hydrostatic pressure converts the Baikal depression into the world's largest artesian well of high water exchange dynamics. The youthful age of Baikal waters is disclosed by the presense of tritium in the deepest horizons of the lake. (Wild-Wisconsin)

Identifiers: Outflow, Bottom processes.

The Great Lakes provide a challenging area for research in limnology, potamology, oceanology, and fisheries biology. Fifteen agencies of the federal government in the departments of Interior, Agriculture, Defense, and Commerce are involved in research, surveys, and studies. At the international level, the International Joint Commission, the Great Lakes Study Group, and the Great Lakes Fishery Commission deal directly with problems; at least 17 private corporations are directly connected with Great Lakes research, use, and marketing. By 1967, research programs were conducted by Canadian federal government agencies, by Ontario government and its agencies, and by universities and research foundations. In the United States, universities, state agencies, and the federal government and one private industry carried on investigations. Programs were proposed on lake meteorology, terrestrial water budget, energy balance and water movement. Major benefits are expected from the use of Lake Ontario as a model ocean in the study of air-water interface problems, water level variations, climate modification by large water bodies, ice formation and dissipation, water movements, evaporation measurement techniques and the physical factors influencing eutrophication, pollution, and sedimentation. PREDICTION OF SOLAR AND ATMOSPHERIC RADIATION FOR ENERGY BUDGET STUDIES OF LAKES AND STREAMS,
Florida Univ., Gainesville.
W. C. Huber, and Armando I. Perez.
Florida Water Resources Center Completion Report, October 29, 1967. 128 p, 11 fig, 2 tab, 25 ref, 2 append. OWRR Project A-014-FLA (1).

Descriptors: *Energy budget, *Solar radiation, *Lakes, *Reservoirs, Surface waters, Hydrologic cycle, Thermal pollution, Thermal stratification, Water temperature, Evaporation.
Identifiers: Atmospheric radiation.

Evaluation of terms in the energy budget is an integral part of the prediction of thermal changes in natural water bodies. Lakes, reservoirs, streams, and tidal waters receive heat from shortwave solar radiation, longwave atmospheric radiation, and advectively from surface water inflows. The net advective heat flux is often zero, in which case the radiation components are the dominant causes of temperature changes. Predictive methods for the two radiation components were developed as a function of meteorological parameters alone (temperature, humidity, cloudiness, opaqueness). These predictive methods can be used in areas where there are no records of radiation measurements, because the required meteorological variables are commonly measured near by. A better predictive equation was found for shortwave radiation than for longwave radiation. Use of the shortwave equations in evaluating temporal temperature changes in a Florida lake resulted in good agreement with measured values. A tabulation of 148 days of hourly radiation and meteorological values is included in the report. (Knapp-USGS)

tifiers: *Seismic survey (Lake Erie).

Geological Survey of Canada, in cooperation
the Ohio Geological Survey, undertook a con-
ous marine seismic profiling survey in the
ern part of Lake Eric during August-Sep-
er 1968. Seismic coverage, totalling 818 mi,
obtained approximately every 5 minutes of
de and longitude west of Point Pelee in both
dian and United States waters. Record quality
s considerably over the survey area. East of
and Kelleys Islands, data are good and pro-
a reliable interpretation of thickness of bottom
nents and stratification within them. The
rnmost portion of the basin, yields poor data;
s probably due to gaseous organic material,
bodies, or buried peat deposits. Drift
ness from drill holes and from the survey cor-
well and range from zero up to 120 ft. A
r reflector within the drift indicates the sur-
of glacial deposits and the general pattern of
glacial and postglacial drainage during low-
phases of Lake Erie. Offshore bedrock eleva-
varies between 390 and 571 ft above sea level.
ock highs underlie Point Pelee and the islands
eas bedrock lows in inter-island areas and the
al basin are readily outlined. An interpreta-
of preglacial drainage is presented. (See also

CHEMICAL COMPOSITION OF SOME INLAND SURFACE WATERS AND LAKE DEPOSITS OF NEW SOUTH WALES, AUSTRALIA,
Monash Univ., Clayton (Australia). Dept. of Zoology.
W. D. Williams, K. F. Walker, and G. W. Brand.
Australian Journal of Marine and Freshwater Research, Vol 21, No 2, p 103-116, December 1970. 14 p, 2 fig, 5 tab, 25 ref.

Descriptors: *Water chemistry, *Lakes, *Salinity, Arid lands, Brines, Water quality, Sampling, Data collections, Phosphates, Nitrates, Chlorides, Sedium, Bicarbonates, Sulfates.
Identifiers: *Australia, *New South Wales (Australia).

Chemical data are presented for several lakes and two impoundments on the Kosciusko and Monaro plateau in south-eastern New South Wales, Australia, and for two rivers (Paroo and Darling), several freshwater lakes, and deposits from some dry salt lakes in western New South Wales. The concentrations of the major cations and anions, nitrate, and orthophosphate were investigated. For lake deposits, only major ions were investigated. The Kosciusko lakes were extremely fresh and chemically dominated by sodium and either bicarbonate, chloride or sulphate ions; the Monaro peneplain lakes had a considerable salinity range (69-21,244 p.p.m.), and, with increasing salinity, sodium and chloride assume dominance. The Paroo and Darling Rivers had salinities less than 400 p.p.m. and the western freshwater lakes less than 850 p.p.m.; in both rivers and lakes, sodium and bicarbonate were the dominant ions. Deposits from dry salt lakes were mainly sodium chloride. (Knapp-USGS)

2I. Water in Plants

POTENTIAL USEFULNESS OF ANTITRANSPIRANTS FOR INCREASING WATER USE EFFICIENCY IN PLANTS,
California Univ., Davis. Water Resources Center.
Robert M. Hagan, and David C. Davenport.
Available from NTIS as PB-197 930, $3.00 in paper copy, $0.95 in microfiche. California University Water Resources Center Technical Completion Report W-174, December 1970. 66 p, 27 fig, 26 tab, 30 ref. OWRR Project B-054-CAL (1).

Descriptors: *Water conservation, *Soil-water-plant relationships, *Evapotranspiration control, *Transpiration control, Plants, Chemcontrol, Thin films, Application methods, Water loss, Moisture content, Retardants, Surface tension, Hydrometry, Photosynthesis, Vegetation, Leaves, Consumptive use.
Identifiers: Water balance control (Plants).

Antitranspirants conserve water and maintain favorable plant water balances by reducing stomatal apertures, by forming a thin film over the leaves, or by reflecting excessive radiation. Under normal conditions, reductions in both transpiration and photosynthesis are to be expected, but reduction in growth does not always occur, and need not always be disadvantageous when it does. Antitranspirant effects on stomata were judged indirectly by porometry (mass flow or rate hygrometer), and directly by microscopic measurement of stomatal apertures from epidermal peels. The relationship between diffusive resistance and stomatal aperture was determined. It was found that a film antitranspirant, by increasing plant water potential, actually increases the aperture of stomata lying immediately under it. Direct stomatal measurements enabled assessment of the effects of the stomatal-closing antitranspirant, phenylmercuric acetate (PMA). It was discovered that PMA not only retards stomatal opening, but also retards closure, thereby increasing transpiration under conditions of low light or low water supply. The effects of various alkenylsuccinic acids (stomatal-closing antitranspirants which do not contain heavy metals) on the rates of transpiration and photosynthesis were measured. (Woodard-USGS)

VEGETATION COMPARISONS BETWEEN THE MEDITERRANEAN CLIMATIC AREAS OF CALIFORNIA AND CHILE,
Stanford Univ., Calif. Dept. of Biological Sciences.
H. A. Mooney, E. L. Dunn, Frances Shropshire, and Leo Song.
Supported by the NSF (GB 5223 and GB 8184) and the Ford Foundation's University of California-University of Chile Convenio. Flora, Vol 159, No 5, p 480-496, 1970. 3 fig, 3 tab, 25 ref.

Descriptors: *Plant populations, *Climatic zones, *Vegetation, *Shrubs, *Trees, Arid lands, Semiarid climates, Temperature, Precipitation (Atmospheric), Soil moisture, Environmental effects,

Ecology, Drought tolerance, Xerophytes, Habitats, Gradation, Distribution, Moisture availability, Geographical regions, Biological communities, California, Comparative productivity, Altitude, Forests.
Identifiers: *Chile, *Mediterranean climates, *Evergreens, *Succulents.

The Mediterranean regions of the world are widely separated and have taxonomically quite unrelated floras. However, they possess vegetations with comparable functions and physiognomies. In terms of climatic gradients, topographic configurations and land-use histories, Chile and California are the most comparable Mediterranean-Climatic regions, thus facilitating extremely direct vegetation comparisons. Both areas have the same general vegetation gradients. Going from the mesic to the arid end of the climatic gradient, homologous plant community types occur: closed evergreen forest, dense evergreen scrub, low scrub with many drought-deciduous elements and low scrub with many succulents. There are no common genera between the 2 regions, making clear that any structural similarities must be due to evolutionary convergence. Precipitation gradients extended from 80-1600 mm and latitudes spanned from 30-43 deg. There is a remarkable alignment of homologous community types with equal low elevation climatic regions. The very arid areas have sparse vegetation composed of slow-growing succulents and a diversity of drought-evading and enduring forms. With somewhat less aridity, the dominant forms are drought deciduous shrubs. Only evergreens that are very specialized occur. At the evergreen scrub level, soil water is available at depth, hence most shrubs are deep-rooted. Internal convergence is highest at this level but there is a degree of discordance between California and Chile. Low evergreen scrub in Chile has more drought-deciduous elements than California. Also, the rich Montane forests of the Sierra Nevada are lacking in the Andes. There are also equal latitudinal replacements of community types. (Casey-Arizona)

Identifiers: *Israel, *Cambium, *Shoots.

P. euphratica, a native of Israel, exhibits several growth processes and a wide variety of wood types. Twenty-one adult trees growing on the eastern slope of a canyon near a stream were measured for annual increments of shoot elongation for several years in an effort to establish relationships between shoot elongation and cambial initiation in diffuse and ring porous trees. The habit was classified by levels on the basis of water supply: (1) water level; (2) mid-level, wet; (3) mid-level, dry and (4) slope level, dry. Growth was compared among trees at the various levels. Regressions of annual increment were performed on width of the current ring, width of the former extension increment ring, and mean width of annual extension growth. Shoot elongation of trees on dry sites was restricted and associated with narrow annual rings and ring porous wood. On wet sites, vigorous shoot growth was associated with wide annual rings and diffuse porous wood. Cambial growth characteristics are clearly correlated with shoot elongation and environmental influences are indirect. (Casey-Arizona)

Identifiers: *Metabolic inhibitors, *Reflection coefficients, *Osmotic flow.

Unidirectional radial fluxes of tagged Na, Cl and phosphate ions were measured across root 'sleeve' preparations. Since these preparations are extremely similar to epithelial preparations such as frog skin, active and passive ionic movements could be differentiated by use of the Ussing flux equations. At any given concentration, cation fluxes were 1 to 3 orders of magnitude greater than anion fluxes. The flux ratios indicated cation movement was largely passive while anion movement was dependent upon active cell pumping. The Cl influx was inhibited by KCN and increased by DNP, while K fluxes were unaffected by both metabolic inhibitors. Steady-state flux equations yield permeability coefficient values from which apparent diffusion coefficient values may be calculated. The resulting data indicate that radial ion movements must be through, rather than between, root cells. Anion movements are probably linked to the electron-flow system and not to ATP. Data must be interpreted cautiously, however, in view of endodermal damage. (Casey-Arizona)

PROSPECTS FOR PHOTOSYNTHESIS FROM A.D. 1970 TO A.D. 2000,
Nottingham Univ. (England). Dept. of Physiology and Environmental Studies.
J. L. Monteith.
Weather, Vol 25, No 10, p 456-462, October 1970. 1 fib, 2 tab, 9 ref.

Descriptors: *Photosynthesis, *Carbon dioxide, *Aerosols, *Solar radiation, Estimating equations, Respiration, Crop response, Oceans, Productivity, Atmosphere, Forecasting.
Identifiers: *Insolation, Dry matter.

The rate at which world dry matter is being accumulated at any given time is dependent upon the balance between photosynthate production and it's loss by respiration. Production (Photosynthetic rate) depends upon water, carbon dioxide and solar radiation in the 0.4-0.7 micrometer waveband. It is usually independent of temperature between 10-30C. Respiration rate depends upon the current amount of dry matter accumulated by the plant, photosynthetic rate and temperature. Using projected figures for carbon dioxide release into the atmosphere and assuming two-thirds of it will dissolve into the oceans, it is calculated that the atmospheric content will increase from the current level of 314 p.p.m. to 380 p.p.m. by 2000 A.D. The evidence for insolation decrease by particular scattering is conflicting. Therefore, the estimates of photosynthesis in 2000 A.D. were calculated for 2 plausible cases: (1) Carbon dioxide increasing to 380 p.p.m.; insolation constant; (2) carbon dioxide increasing to 380 p.p.m. and insolation decreasing by 1%/yr. Using condition (1) calculations indicate a 9% increase in gross photosynthesis between 1970-2000. Using (2), there should be a 0% change. Although the figures in themselves should cause no alarm, the author warns a number of contingencies. Even with a 9% increase, population growth will consume the added crop production. Further, changes in the Earth's heat balance could increase respiration, thereby decreasing productivity. It is stressed that such long-term dictions are extremely unreliable. (Casey-Ariz

Descriptors: *Deserts, *Insects, *Ecology, *In tors, *Environmental effects, Heat resista Diapause, Microenvironment, Insect resista Entomology, Animal physiology, Insect beha Environment, Drought tolerance.
Identifiers: *Species, *Adaptation, Namib Des

This paper examines the environmental rela ships of terrestrial desert arthropods. The ta both the North American deserts and the N Desert of southwest Africa indicate very periods of adaptation to desert conditions. Nur cally dominant desert arthropods are mites, pions, spiders, grasshoppers, true bugs, hor terans, bettles, flies, and hymenopterans. O worldwide indicator species for deserts, pos the best are the darkling beetles. Others are s gids, robber flies, beeflies, and some cockroa Less important indicators are also given. desert arthropods are nocturnal or crepusc and the season of activity often coincides moist periods. Many enter diapause to avoid hot, or cold seasons. Many desert arthropod burrowers, and larvae often live in the soil or u rocks. Adaptations of desert-inhabiting arthro include lack of need for drinking water, waxy cle, urtocotelic excretory system, color ad tions, dense pubescence, reflective cuticle, elytral air spaces, thick exoskeleton, large size, legs, high temperature tolerance, behavioral a tations to heat, flightless adaptation to wind treme agression in carnivores, and the abili survive for long periods without food. Supported by U.S. Department of Agricu Grant (PL-480, Project No A10-SWC-7).
tralian Journal of Biological Sciences, Vol 23 5, p 937-945, October 1970. 4 fig, 1 tab, 15 ref

Descriptors: *Halophytes, *Plant gro *Photosynthesis, *Salinity, *Osmotic pres Xerophytes, Laboratory tests, Transpiration, physiology, Carbon dioxide, Sodium chlo Sodium sulfate, Leaves, Stomata, Plant morph gy, Resistance, Salts, Absorption.
Identifiers: *Succulence, *Leaf area, *W potential, *Leaf mesophyll.

Some Atriplex species may require small amo of salt for optimum growth. A study was ma the growth of A.halimus under various saline ditions, in which the effects of NaCl and Na su in the nutrient media were compared. Accomp ing changes in leaf transpiration and photosynt were also measured. Either salt at low conce tions in the growth media stimulated total leaf succulence and overall growth. At osmotic sures less than -5 atm, growth depression resu Salinity responses apparently operated throug ferent mechanisms, since sap osmotic potenti NaCl-exposed plants underwent osmostic a ment while the Na sulfate-exposed plants sh only a partial osmotic adjustment. As salinit creased, stomatal resistance to water loss and bon dioxide uptake increased, offsetting the salinity beneficial effects of greater leaf su area for transpiration and photosynthesis.

NaCl concentrations and all Na sulfate concentrations increased mesophyll resistance to carbon dioxide uptake, which also acted to decrease photosynthesis. Finally, as salinity increased, lateral bud sprouting increased, implying a reduction in apical dominance. Possibly salinity disrupted plant hormonal balance. (Casey-Arizona)

GENETIC PROBLEMS OF HOT DESERT POPULATIONS OF SIMPLE TECHNOLOGY,
Newcastle-upon-Tyne Univ., (England). Lab. of Human Genetics.
D. F. Roberts.
Contribution to a Symposium on Climatic challenge and Population Pressure, London, 30 November 1968. Human Biology, Vol 42, No 3, p 469-485, September 1970. 4 fig, 24 ref.

Descriptors: *Arid lands, *Genetics, *Social aspects, *Cultural control, *Water shortage, Social behavior (Animals), Environmental effects, Mode of action, Ecology, Human population, Human resources, Biomass, Habitats, Animal behavior, Food chains.
Identifiers: *Adaptation, *Australia, *Aborigines.

Human inhabitants of hot deserts are pictured as carnivores on top of a fragile food chain limited in biomass because of limitations in plant growth. The mechanism of survival of primitive technology populations in hot deserts is universal--the use of some animal intermediary, whether hunted or herded, which is adapted to survival on meager desert resources. It follows that human desert populations must be small and mobile. Mammal home range sizes as functions of body weight and basal metabolism are considered, and human population density as a function of rainfall is quantitized. The survival of human desert populations may involve either or both of the phenomena of developmental adaptations or genetic adaptations. The genetic adaptations involve 4 interacting component problems: (1) habitation of extreme environments; (2) colonizing populations; (3) migrant populations; (4) small scattered populations. The problems are outlined, but unfortunately, critical data for their resolution are lacking. The intensity of selection is unknown and therefore the extent of polymorphism in desert populations is problematical. A consideration of colonization presents the problem of defining appropriate components of fitness, leasing to the apparent paradox of selection against high fertility. The small populations have theoretical genetic inbreeding problems, but this may be compensated for by cultural factors which mitigate against excessive inbreeding while maintaining high genetic drift possibilities. CHLORIDE INFLUX INTO CITRUS LEAF SLICES,
South Australian Dept. of Agriculture, Adelaide; and Adelaide Univ. (Australia). Dept. of Botany.
J. B. Robinson, and F. A. Smith.
Supported by grants from the Australian Research Grants Committee and the Citrus Industry Research Trust Fund. Australian Journal of Biological Sciences, Vol 23, No 5, p 953-960, October 1970. 8 fig, 2 tab, 18 ref.

Descriptors: *Citrus fruits, *Leaves, *Chlorides, *Metabolism, *Inflow, Plant physiology, Osmotic pressure, Sodium, Potassium, Calcium, Sulfates, Energy transfer, Laboratory tests, Mode of action, Salinity, Tracers, Radiochemical analysis, Irrigation effects, Ions, Nitrogen, Sodium chloride, Cation adsorption, Anion adsorption.
Identifiers: *Citrus plants, *Cations, Anions.

Leaf material may be sampled and analyzed as a means of assessing the state of the whole plant with respect to detrimental ions or nutrients. Freshly cut citrus leaf tissue (Citrus sinensis) was sliced, rinsed and incubated in standard experimental solutions containing 0.5 mM Ca sulfate and NaCl at concentrations between 0.1-100 mM. Radioactive chloride ions were used and chloride influxes into the slices were measured after 2 hrs. Cl uptake from 10mM NaCl was linear over the 2 hr., increased with mounting external Cl concentration, and was increased by increasing accompanying Na or K ion concentrations. Influxes were little affected in the dark as opposed to the light, but under anaerobic conditions, they declined steeply. The metabolic inhibitor, DNP, which uncouples respiration, inhibits influx under aerobic conditions, regardless of light. A high concentration of CMU, which prevents non-cyclic electron flow, was needed to reduce influx in the light under nitrogen. These results suggest that: (1) anion and cation influx mechanisms cannot be separated; (2) Cl influx is linked to oxidative phosphorylation, but cyclic photophosphorylation may provide an alternate energy supply and (3) there is no evidence for 2 distinct Cl transport systems. The data also explains the phenomenon of slower onset of salinity damage to citrus trees by water containing NaCl when they are spray-irrigated at night. (Casey-Arizona)

GEOGRAPHICAL REGULARITIES IN THE PRODUCTIVITY AND THE CIRCULATION OF CHEMICAL ELEMENTS IN THE EARTH'S MAIN VEGETATION TYPES,
Akademiya Nauk SSSR, Moscow. Pochvennyi Institut; and Akademiya Nauk SSSR, Moscow. Botanicheskii Institut.
N. I. Bazilevich, and L. Ye. Rodin.
Soviet Geography: Review and Translation, Vol 12, No 1, p 24-53, January 1971.

Descriptors: *Biomass, *Biological communities, *Vegetation, *Productivity, Climatic zones, Nutrient requirements, Distribution patterns, Environmental effects, Mapping, Tropical regions, Vegetation effects, Humus, Organic matter, Environmental gradient.
Identifiers: Chemical elements.

The mass of the biosphere is extremely small relative to the masses of the lithosphere on hydrosphere, and is composed mainly (Almost 99%) of phytomass. By virtue of constant recycling, living matter maintains a tremendous effect on geochemical processes despite its relatively small mass. The geochemical work of the phytomass may be described, dynamically, as the accumulation of matter and energy/unit time. The appropriate measurements are annual increment/unit area in the above-and underground plant communities, subdivided into structural elements. Indices of the amounts phytomass and dead organic matter give a static picture of the potential reserves of matter and energy accumulated by the plant community as of a given moment. Using a 10-point rating scale, the geographical distribution of potential productivity and of the biological circulation of the principal vegetation types is mapped and analyzed in terms of 6 parameters. From the arctic to equatorial Africa, phytomass magnitude forms a triple-crested sinusoidal distribution, with maxima occurring, from north to south, between arctic desert and broadleaf forest, between subboreal desert and subtropical forest and between subtropical and tropical rain forest except for a slight decrease at semiarid and arid steppes. Productivity is therefore not proportional to phtomass magnitude, but is associated with herbaceous woody and herbaceous communities. Annual growth and biological carring capacity and intensity increase steadily from tundra to coniferous forest to broadleaf forest and steppe, leaching maxima in the humid subtropics and tropics. In deserts, both productivity and carrying capacity are low, but the intensity of biological circulation is high. (Casey-Arizona)

DIFFERING SENSITIVITY OF PHOTOSYNTHESIS TO LOW LEAF WATER POTENTIALS IN CORN AND SOYBEAN,
Illinois Univ., Urbana. Dept. of Botany.
J. S. Boyer.
Plant Physiology, Vol 46, No 3, p 236-239, March 1970. 3 fig, 26 ref. OWRR Projects A-028-ILL (3) and B-036-ILL (7).

Descriptors: *Stomata, *Photosynthesis, *Drought tolerance, *Transpiration, *Metabolism, Leaves, Drying, Corn (Field), Soybeans, Carbon dioxide, Soil-water-plant relationships, Laboratory tests, Mode of action, Moisture stress, Water balance, Environmental effects, Temperature, Permeability, Diffusion, Boundary layers, Resistance, Inhibition.
Identifiers: *Water potential.

Some evidence has accrued for advancing the thesis that plant species having the 4-carbon dicarboxylic acid photosynthetic pathway are, for biochemical or morphological reasons, more drought resistant. Corn (Zea mays) and soybeans (Glycine max) were subjected to drought and photosynthetic and transpiration rates and leaf air permeabilities were measured at various levels of water potential. Diffusive resistances to carbon dioxide entry could be calculated. In corn, photosynthetic rates were inhibited at water potentials of -3 bars and photosynthesis ceased at -16 bars. The equivalent figures for soybeans were -11 and -41 bars. As leaf water potentials dropped, photosynthesis inhibition in both species did not occur until transpiration reduction and stomatal closure also occurred. Therefore, photosynthesis inhibition seemed dependent on stomatal behavior. Since corn has a 4-carbon photosynthetic pathway while soybeans do not, such a pathway does not seem to confer greater drought tolerance. However, at any given level of water potential down to -16 bars, corn photosynthetic rates were greater than those of soybeans, so the results must be carefully interpreted. (Casey-Arizona)

Identifiers: *Israel, *Analysis of variance, Grumosols, Lithosols, Rendzinas.

Trifolium is one of the world's largest plant genera. A group of species are native to Israel, Jordan, Syria and Lebanon and are usually distributed in relation to edaphic conditions. Whether the presence of a species in a given soil is incidental is not known. Five Trifolium species and 1 hybrid, alexandrinum, berytheum, vavilovi, carmeli, plebeium and pilulare X subterraneum were grown together in 10 different soil types, including basalts, heavy alluvial grumosols, light rendzinas, light brown lithosols and water logged sandy loams, and their growth characteristics were compared. The differences between species and between soils in weights of the upper parts of the plants were very large and statistical analysis showed that the variability depended on soil types and plant species that did not share a common variance. Compared to shoot weight, root weight differences due to species were much more conspicuous than differences due to soil. Some drastic differences in growth oc-

curred, and analyses of variance could not fit the data to either additive or multiplicative models, although the data did fit better to multiplicative models. Soil analyses confirmed that species varied in their ability to utilize favorable edaphic conditions. (Casey-Arizona)

THE PARTITIONING OF RESISTANCES TO PHOTOSYNTHETIC CARBON DIOXIDE UPTAKE IN THE LEAF,
California Univ., Los Angeles. Lab. of Nuclear Medicine and Radiation Biology.
Dov Koller.
AGC Contract AT (04-1) GEN-12. New Phytologist, Vol 69, No 4, p 971-981, October 1970. 5 fig, 1 tab, 9 ref.

Descriptors: *Resistance, *Carbon dioxide, *Photosynthesis, *Leaves, *Absorption, Theoretical analysis, Model studies, Stomata, Structure, Plant morphology, Plant physiology, Diffusivity, Epidermis, Mode of action, Transpiration, Analog models, Plant tissues, Resistance networks, Boundary layers.
Identifiers: *Water potential, *Leaf mesophyll, *Leaf anisolaterality.

The liquid phase in a leaf will tend to remain at a uniform water potential, preventing development of concentration differences in the vapor phase. By contrast, leaf tissues differ in their ability to fix carbon dioxide and in boundary layer, epidermal and pathway resistances to carbon dioxide diffusion. It follows that transpiration is not limited by any intercellular pathway resistance, but that photosynthesis is likely to be greatly affected. The various resistances to carbon dioxide may be fractionated into subcomponents and treated algebraically as electrical resistances. Taking into account resistances involving mesophyll resistances in the upper and lower chlorenchyma and resistance between the upper and lower leaf layer including leaf anisolaterality, an electrical analogue model was constructed to show the partitioning of overall resistance to photosynthetic carbon dioxide uptake in a bilateral leaf. Mesophyll component resistance is usually calculated by subtracting diffusional resistance component from total carbon dioxide uptake resistance. Calculations show that considerable error arises in the estimation of mesophyll resistance when internal diffusion and epidermal and/or mesophyll anisolaterality are neglected. Using parallel chambers and a diffusion porometer, the appropriate parameters may be measured and used to correct mesophyll resistance calculations. As the mesophyll resistance increases, component error factor resistances decrease relatively. (Casey-Arizona)

GROWTH OF ATRIPLEX HALIMUS L. IN SODIUM CHLORIDE SALINATED CULTURE SOLUTIONS AS AFFECTED BY THE RELATIVE HUMIDITY OF THE AIR,
Hebrew Univ., Jerusalem (Israel). Dept. of Botany.
J. Gale, R. Naaman, and A. Poljakoff-Mayber.
USDA Project No A10-SWC-7. Australian Journal of Biological Sciences, Vol 23, No 5, p 947-952, October 1970. 7 fig, 10 ref.

Descriptors: *Humidity, *Salinity, *Plant growth, *Environmental effects, *Physiological ecology, Leaves, Halophytes, Xerophytes, Osmotic pressure, Sodium chloride, Mode of action, Laboratory tests, Vapor pressure, Turgidity, Growth chambers, Arid climates, Humid climates, Climatology.
Identifiers: *Relative humidity, *Seedlings, *Water potential.

It has been shown that A. halimus plants in the laboratory demonstrate varying patterns of growth and physiological behavior in response to salinity differences, just as plants in the wild show varying patterns with season. In attempting to establish and interdependence between climatic and salinity effects, one climatic parameter--relative humidity (RH)--was examined. Two groups of seedlings were grown under identical climatic conditions in growth chambers, except that 1 group was exposed to about 65% RH and the other to about 27% RH. Each group was subdivided according to salinity media osmotic pressures, ranging from 0 to -20 atm. The plants showed very apparent differences in growth under the 2 conditions of humidity. (1) Dry-air plants showed maximum growth curves at -5 atm while humid-air plants showed a steady growth decline from a 0 atm optimum. (2) Plants grown with no NaCl (0 atm) in the humid chamber had a low fresh weight/dry weight ratio which showed an optimum at -3 atm, while the optimum for low humidity occurred at-10 atm. (3) Dry-air plants achieved less turgor and height at 0 atm, but equaled humid-air plants grown at the same salinity when osmotic potentials were -5 atm or less. (4) NaCl reduction of leaf weight/stem weight was greater in humid-grown plants. It is possible that microquantities of NaCl present as impurities may have been essential for growth even in high-humidity plants. The results suggest possible explanations for plant distribution, such as the absence of halophytes in the arid non-saline areas of the Mediterranean region. (Casey - Arizona)

THE INHIBITION OF FLOWERING BY WATER STRESS,
Adelaide Univ. (Australia). Waite Agricultural Research Inst.
D. Aspinall, and I. Husain.
Supported by the U.N. Arid Zone Research Program and the Australian Barley Improvement Trust Fund. Australian Journal of Biological Sciences, Vol 23, No 5, p 925-936, October 1970. 6 fig, 3 tab, 22 ref.

Descriptors: *Moisture stress, *Osmotic pressure, *Flowering, *Inhibition, *Leaves, Laboratory tests, Translocation, Mode of action, Plant physiology, Diurnal, Turgidity, Photoactivation, Plant growth, Water balance, Water requirements, Water utilization, Moisture deficit, Light, Photoperiodism.
Identifiers: *Water potential, *Induction, *Defoliation, *Apical morphogenesis, *Osmotic stress, Cotyledons, Psychrometers.

The inhibition of apical growth by water stress may be mediated through an inhibition of photoperiodically controlled floral induction. This may best be studied in single-cycle plants, such as Lolium temulentum, Pharbitis nil and Xanthium strumarium, where that inductive treatment can be clearly separated from floral development. When L. temulentum was subjected to osmotic stress during it's 16-hr. inductive photoperiod, osmotic stresses of -18 to -24 atm reflected by relative leaf turgidities of 75-78%, resulted in an inhibition of flowering. Osmotic stresses during the 16-hr. inductive dark period of P. nil decreased flowering at -2 atm and eliminated it at -6 atm. Creating stress by withholding water before the 16-hr. dark inductive period of X. strumarium had no effect if it was terminated before the inductive period, but eliminated flowering if it was continued through the inductive period--unless the stress was extremely severe. Indirect evidence suggests that floral stimulus is translocated from an induced lea, and that this process is disrupted by water stress. This was supported by flowering inhibition in plants defoliated during the inductive period. By contrast, mildly stressed plants that were not defoliated during the inductive period formed several flowers, indicating some stability of the floral stimulus during stress periods (Casey-Arizona)

2J. Erosion and Sedimentation

A CONSIDERATION OF POLLEN, DIATOMS AND OTHER REMAINS IN POSTGLACIAL SEDIMENTS,
Iowa State Univ., Dept. of Botany and Plant Pathology; and Iowa Lakeside Lab., Milford.
John D. Dodd, Ruth M. Webster, Gary Collins, and Larry Wehr.
Iowa Academy of Science Proceedings, Vol 75, p 197-209, 1968. 13 p, 5 fig, 2 tab, 15 ref. OWRR Project A-008-IA (2).

Descriptors: *Palynology, *Sediments, *Diatoms, *Pollen, *Iowa, Deposition (Sediments), Stratification, Lakes, Sedimentary structures, Diatomaceous earth, Sedimentation.
Identifiers: *Postglacial sediments, *Lake Okoboji (Iowa).

Pollen and diatoms in post-glacial sediments from a shallow bay of Lake Okoboji, Iowa, is considered. The presence of other microfossils is noted with emphasis on those of Cretaceous origin. Samples were dried at 100 deg C., weighed, and then separated into two portions, one for inorganic C determination and one for total organic matter determination. Samples were treated with trichloroacetic acid and weight loss was determined from liberation of CO2. From this the percentage of inorganic C was calculated. Organic matter determination was done by igniting samples in a 900-1000 deg muffle furnace for six hours per sample. Organic matter percentage was then calculated as the percentage of weight lost minus the inorganic C percentage. At the 27-foot level there is a well-defined population of diatoms which includes 22 genera and 66 taxa. The first appearance of diatoms may be more indicative of the beginnings of biological activity in a post-glacial lake than the presence of pollen which might be blown in from some distance. The pollen counts, from the top to the 27-foot level, indicate that no drastic change in the surrounding land vegetation occurred. (Woodard-USGS)
W71-05340

ORIGIN OF CLAY MINERALS IN A MID-ATLANTIC RIDGE SEDIMENT,
Massachusetts Inst. of Tech., Cambridge. Dept. of Earth and Planetary Sciences.
R. A. Copeland, F. A. Frey, and D. R. Wones.
Earth and Planetary Science Letters, Vol 10, No 2, p 186-192, January 1971. 7 p, 3 fig, 2 tab, 25 ref. ONR Contract Nonr 1841 (74).

Descriptors: *Clay minerals, *Clays, *Bottom sediments, *Atlantic Ocean, *Provenance, Mineralogy, Sampling, Trace elements, Chemical analysis.
Identifiers: Rare earth elements.

The coarse and fine-grained mineral fractions of a Mid-Atlantic Ridge sediment (22 deg N) have been separated and analyzed for Fe and rare-earth elements (REE). Despite changes in Fe abundance, all the chlorites have REE distributions consistent with a derivation from ridge greenstones. The REE distribution of the fine-grained montmorillonite is similar to that of shales, yet differs markedly from that of a coarse locally derived iron-rich montmorillonite. A continental origin for the fine-grained montmorillonite is implied. (Knapp-USGS)

REMOVAL OF A SPHERICAL PARTICLE FROM A FLAT BED,
Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
Charng Ning Chen.
Georgia Institute of Technology Environmental Resources Center Report ERC-0770, November 1970. 96 p, 24 fig, 11 tab, 33 ref.

Descriptors: *Sediment transport, *Scour, Hydraulic models, *Tractive forces, Flow, Fluid friction, Hydrostatic pressure, Hydrodynamics, Hydraulic similitude, Statistical methods, Laboratory tests, Bed load.
Identifiers: *Hydrodynamic lift, *Sediment entrainment.

The mechanics of the process by which a sediment particle is removed from a stream bed was investigated by study of an idealized model, consisting of a one-inch diameter sphere protruding through a flat plate. By means of this model, the statistical variables of the angle of repose, the protrusion condition, and the approach velocity distribution became controllable at deterministic values. Initial motion of the particle is a fluctuating phenomenon which must be described in probabilistic germs because the fluid-dynamic force is fluctuating in nature. The transition from a stationary state to the removal of the spherical particle was found to be gradual rather than instantaneous. The transition is characterized by the random rocking motion of the sphere. The fluid-dynamic moments and forces were determined experimentally in air flow with both uniform and nonuniform approach velocity profiles. The ratio of the coefficient of lift to drag decreased from 1.6 to 0.4 as the ratio of the protrusion height to the sphere diameter increased from 25 percent to 100 percent. (Knapp-USGS)

A TROPICAL EXAMPLE OF TOPSOIL ENRICHMENT BY FLOOD SILT,
South Pacific Regional Coll. of Tropical Agriculture, Alafua (Western Samoa).
J. G. Reynolds.
Journal of Hydrology (New Zealand), Vol 9, No 1, p 32-35, 1970. 4 p, 1 tab, 6 ref.

Descriptors: *Floods, *Silts, *Organic matter, *Deposition (Sediments), *Fertilization, Silting, Sediments, Soil-water-plant relationships.
Identifiers: *New Zealand.

The sediments deposited during a flash flood estimated to have had a peak discharge of the order of 1000 cusecs are demonstrated to have considerably enriched the topsoil of several acres of productive valley alluvium. The probability that this is a recurring rejuvenation process is discussed. As the flood subsided a thin layer of fresh river silt was deposited over much of the valley bottom. In small local depressions this was 4-5 cm deep. As this layer dried out it developed the polygonal cracks typical of material with a high clay-silt content. The silt has a higher level of organic carbon and total nitrogen than the soil. In fact, some of the sediments had a thin black skin of organic matter on drying out. The individual exchangeable cations and cation-exchange are twice as high in the flood sediment as in the topsoil. These richer sediments were deposited over much of the area occupied by various vegetable test plots. Although some damage was caused by the flood, river sedimentation was in this case beneficial, because the rich sediments were deposited in thin layers which could easily be incorporated into the topsoil by plowing. NEARSHORE SEDIMENT SURVEY OF WESTERN LAKE ONTARIO, METHODS AND PRELIMINARY RESULTS,
Department of Energy, Mines and Resources, Burlington (Ontario). Canada Center for Inland Waters.
N. A. Rukavina.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 317-324, 1969. 8 p, 3 fig, 1 tab, 8 ref.

Descriptors: *Bottom sediments, *Lake Ontario, *Surveys, Sampling, Profiles, Stratigraphy, Sounding, Cores, Provenance, Data collections, Erosion, Sedimentation, Currents (Water), Sediment transport, Great Lakes.
Identifiers: Niagara River.

Surface sediment samples, echo sounder profiles, and bottom observations by divers and with underwater television are used to map the sediments and bottom morphology of nearshore Lake Ontario (depth 0-20 m). In 1968 mapping was completed in western end of the Lake from Niagara on the south shore to Whitby on the north shore. Six bottom types are recognized and delineated: (1) bedrock 23%, (2) glacial drift 39%, and the recent sediments (3) gravel and pebbly sand 9%, (4) sand 12%, (5) silt-sand 10%, and (6) silt-clay 7%. Recent sediments occur: (1) on the south shore from Niagara to Jordan, (2) on the west shore opposite the Burlington Bar, and (3) on the north shore opposite Metropolitan Toronto. The deposits at Toronto and Niagara result from local erosion of shore bluffs; westward-moving longshore currents supply the sediment accumulating offshore from the Burlington Bar. ORGANIC MATTER IN THE SEDIMENTS OF LAKES ONTARIO AND ERIE,
Department of Energy, Mines and Resources, Burlington (Ontario). Canada Center for Inland Waters.
A. L. W. Kemp.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 237-249, 1969. 13 p, 4 fig, 2 tab, 24 ref.

Descriptors: *Bottom sediments, *Organic matter, *Lake Erie, *Lake Ontario, Cores, Sampling, Silts, Clays, Mud, Humic acids, Fulvic acids, Sedimentation, Paleoclimatology, Paleohydrology, Lakes, Sediment-water interfaces, Great Lakes.

Organic carbon and carbonate carbon were determined in six piston cores from Lake Ontario and four piston cores from Lake Erie. The changes in organic carbon with depth of burial are related to sediment type and Eh. Nitrogen, bitumens, humic acids, fulvic acids and kerogen were measured in three surface sediment samples from each Lake. The basin sediments of Lake Ontario consisted of black laminated grey silty clay muds overlying grey glacial clay, with mud thicknesses ranging from 4.6 to 13.8 m in the cores. Organic carbon content decreased 50% in the top 20 cm of sediment and then gradually decreased to 1% at the glacial clay contact. A complex organic carbon horizon was found two thirds of the way down the post glacial mud cloumn at each core station and was attributed to a warmer climate between 4000 and 7500 years BP. Bitumens accounted for 3 to 6% of the organic matter, humic and fulvic acids for 19 to 27% and kerogen for 35 to 49% in the surface centimeter of sediment, in the main basins of the two Lakes. Descriptors: *Bottom sediments, *Lakes, *Michigan, *Deltas, *Particle size, Variability, Cores, Statistical methods, Provenance, Sedimentation, Sediment transport, Sampling, Data processing, Data collections, Statistics, Great Lakes.
Identifiers: *Lake St. Clair, Muscamoot Bay.

Grain size analysis from sediment cores taken in the Big Muscamoot Bay and Goose Bay of the St. Clair River Delta show a great variability in the sediments. A variability index was defined and core parameters were constructed. The variability index has a log-normal distribution and is directly correlated to mean grain size of the sediment. Extent of the sedimentation area increases both mean grain size and variability. Higher order trend surfaces of the sediment parameters reveal strong trends in the direction of the bay axes but inconsistent trends across the bays. The amount of very coarse grains is large in the Outer Muscamoot Bay, more than 1.5% by weight. The investigated data suggest stable conditions since the beginning of deltaic sedimentation 12,000 years ago. (See also W71-05561) (Knapp-USGS)

CHARACTERISTICS OF LAKE MICHIGAN BOTTOM PROFILES AND SEDIMENTS FROM LAKESIDE, MICHIGAN TO GARY, INDIANA,
Army Coastal Engineering Research Center, Washington, D.C.
Eugene F. Hawley, and Charles W. Judge.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 198-209, 1969. 12 p, 6 fig, 21 ref.

Descriptors: *Bottom sediments, *Lake Michigan, *Indiana, *Sand bars, Beaches, Sands, Water circulation, Distribution patterns, Profiles, Currents (Water), Sedimentation, Provenance, Mineralogy, Particle size, Particle shape, Stratigraphy, Erosion, Scour, Beach erosion, Great Lakes.
Identifiers: Bottom profiles (Lake Michigan).

In order to evaluate the effects of lake levels and other factors on littoral processes the U.S. Army Corps of Engineers' Coastal Engineering Research Center is studying the southeastern shore of Lake Michigan from Lakeside, Michigan to Gary, Indiana, a distance of 34 mi. During 1966 and 1967 hydrographic profiles and approximately 500 sand samples were taken and analyzed. Profiles in the study area generally exhibit one or two offshore bars. Similar bars along this section of the coast have been previously described as stable; however, this study illustrates shifting from one year to the next. The profiles also indicate that accretion is predominant in the study area. Beach and bottom sediments in the study area are generally subround

quartz sand of various brownish tones with approximately 3n5% metamorphic (resistate) minerals; however, some coarse sediments contain nearly 100% rock fragments. Areally, sediment distribution trends follow the coastline and bathymetry and are stable from one year to the next. In general, medium sand predominates above waterline; the coarsest material occurs at the waterline. Offshore, medium and fine sands occur; fine sand is predominant. Littoral drift is toward the WSW. SEDIMENTS AND GEOLOGY OF BOIS BRULE RIVER, WESTERN LAKE SUPERIOR,
Wisconsin State Univ., Superior. Dept. of Geology.
Albert B. Dickas, and Paul C. Tychsen.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 161-169, 1969. 9 p, 6 fig, 10 ref. OWRR Project A-023-WIS (6).

Descriptors: *Bottom sediments, *Lake Superior, *Provenance, *Wisconsin, Bed load, Sediment transport, Geology, Mineralogy, Mapping, Sands, Silts, Clays, Glacial drift, Sedimentation, Streamflow, Sediment load, Great Lakes.
Identifiers: *Bois Brule River (Wis).

A sedimentary analysis was made of the bed load of the Bois Brule River, Douglas County, Wisconsin to study the statistical characteristics of the clastic material and the Holocene sedimentation history of the Wisconsin shoreline of Lake Superior. The average mean size distribution of the clastic load, based on the phi scale, is 10% granules, 74% sand, 13% silt and 3% clay. To determine whether this dominantly sand-sized sediment was derived from basement rock or glacial debris, stream gravels larger than granule size were petrographically analyzed and compared to surficial and basement rock maps. The glacial cover is the prime source of the clastic material of the river load; mapping shows that outwash sands and reworked glacial drift predominate over much of the drainage area. A secondary source is outcropping Keweenawan (Cambrian) sandstones. The river load is deposited in Lake Superior out to a distance of 1/2 - 1 mile from the shoreline. GEOCHEMICAL CHARACTERISTICS OF LAKES MICHIGAN AND SUPERIOR SEDIMENTS,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
Edward Callender.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 124-160, 1969. 37 p, 6 fig, 10 tab, 28 ref, 3 append. NSF Grants GA 1337 and GA 4507. FWQA Grant WP-00311.

Descriptors: *Bottom sediments, *Lake Michigan, *Lake Superior, *Water chemistry, *Sediment-water interfaces, Connate water, Mineralogy, Equilibrium, Ion exchange, Ion transport, Diagenesis, Geochemistry, Oxidation-reduction potential, Iron, Calcium, Magnesium, Sodium, Potassium, Manganese, Chlorides, Sulfates, Silica, Great Lakes.
Identifiers: *Sedimentary geochemistry.

More than 140 sediment samples from Lakes Michigan and Superior were analyzed for calcium, magnesium, iron, manganese, inorganic carbon, organic carbon, and total nitrogen content. Interstitial water from these same samples was analyzed for dissolved calcium, magnesium, sodium, potassium, iron, manganese, chloride, sulfate, and silica content. Most of the sedimentary calcium and magnesium is combined in the carbonate minerals calcite and dolomite. The remainder, especially magnesium, is associated with clay minerals. The instability of sedimentary carbonate minerals after burial is reflected in the significant increase of interstitial calcium and magnesium over lake water concentrations. Lake Michigan interstitial water is saturated with respect to calcite and dolomite while fluid from Lake Superior sediment approaches saturation with calcite but is undersaturated with respect to dolomite. Interstitial water from all lake sediments is in equilibrium with kaolinite and approaches saturation with respect to montmorillonite, chlorite, and amorphous silica. Essentially all sedimentary manganese originates in authigenic hydrated oxides. Sedimentary iron does not vary appreciably with depth in the sediment, while manganese increases significantly near the sediment-water interface. (See also W71-05561) (Knapp-USGS)

THE GOLDSBORO RIDGE, AN ENIGMA,
North Carolina State Univ., Raleigh. Dept. of Soil Science; and North Carolina Univ., Chapel Hill. Dept. of Geology.
R. B. Daniels, E. E. Gamble, and W. H. Wheeler.
Southeastern Geology, Vol 12, No 3, p 151-158, January 1971. 8 p, 3 fig, 2 ref.

Descriptors: *Sedimentary structures, *Sandbars, *Terraces (Geological), *North Carolina, *Coastal plains, Sands, Sedimentation, Erosion, Stratigraphy, Beaches, Berms, Geomorphology, Surfaces, Water levels.
Identifiers: *Goldsboro ridge (NC).

The Goldsboro ridge is a sand body 25 feet high that rises above the Sunderland surface near Goldsboro, North Carolina. It consists of unfossiliferous sands with a few intercalated clay beds. The ridge is neither an erosional outlier nor an eolian feature. It is a depositional ridge, probably of marine origin. The relationships among the height and orientation of the ridge, the elevation of the toe of the nearby Kenly scarp, the location of a distinctive slate knoll immediately northwest of the ridge, and the position and orientation of the Neuse and Little Rivers are all compatible with a marine origin. The Goldsboro ridge and the Kenly scarp are the major evidences of a former post-Miocene sea stand above 95 feet (Surry scarp). (Knapp-USGS)

HYDROLOGIC EFFECTS OF QUATERNARY SEDIMENTS ABOVE THE MARINE TERRACES IN THE GEORGIA COASTAL PLAIN,
Agricultural Research Service, Tifton, Ga. Southeast Watershed Research Center.
Loris E. Asmussen.
Southeastern Geology, Vol 12, No 3, p 189-201, January 1971. 13 p, 7 fig, 15 ref.

Descriptors: *Aquifers, *Dunes, *Alluvium, *Georgia, *Coastal plains, Sedimentation, Stratigraphy, Geomorphology, Quaternary period, Permeability, Aeolian soils, Sinks, Karst.
Identifiers: Coastal plain sedimentation.

Quaternary and Recent aeolian and fluvial sands have a characteristic distribution pattern on watersheds in the Coastal Plain of Georgia. The streams lie on the western side of south-draining valleys, and the maximum aeolian and fluvial sediment thickness (sand dunes) is attained east of the stream and on the west-facing valley flank. These sediments form a highly permeable veneer over the older marine formations. They vary in thickness throughout the watershed with the maximum being 20 to 25 feet, and act as a shallow phreatic aquifer, making groundwater available to deep recharge, return flow to streams, and evapotranspiration. The aeolian and fluvial sediment distribution was controlled by the source effect on the stream runoff, pond and pit site location, drainage systems, soil development, watershed infiltration rates, and stream location. (Knapp-USGS)

SEDIMENT BUDGETS ON A COMPARTMENTED LOW-TO-MODERATE ENERGY COAST IN NORTHWEST FLORIDA,
Florida State Univ., Tallahassee.
F. W. Stapor.
Marine Geology, Vol 10, No 2, P M1-M7, February 1971. 7 p, 3 fig, 4 ref.

Descriptors: *Sediment transport, *Coasts, *Littoral drift, *Surf, Barriers, Sand bars, Bottom sediments, Waves (Water), Currents (Water), Dunes, Sands, Islands.
Identifiers: *Sediment budgets.

Sediment budgets for portions of the Franklin and Gulf County, Florida, coast were determined through comparison of old U.S. Hydrographic Office smooth sheets. Rate of erosion and deposition and minimum distances of transport were computed. This coast is divided into at least six individual compartments (or longshore drift cells) which probably experience minimal communication; in each instance erosion and deposition are nearly balanced. This is a result of the low-to-moderate wave energy and the offshore bathymetry of the region. (Knapp-USGS)

ke Balaton, Hungary, large quantities of fine d, high-magnesian calcite are precipitated the warmer seasons by a strong growth of plankton. The formation of high-magnesian e can be related to the high Mg/Ca ratio of the vater which varies locally between about one nree. The elecyrolyte concentration of the water is less than 500 mg/liter. The high a ratio of the lake water influences both the llization of aragonite and high-magnesian e as is the case under marine and some hyper- conditions. (Woodard-USGS)

HEAVY MINERALS IN BEACH AND STREAM SEDIMENTS AS INDICATORS OF SHORE PROCESSES BETWEEN MONTEREY AND LOS ANGELES, CALIFORNIA,
Army Coastal Engineering Research Center, Washington, D.C.
Charles W. Judge.
CERC Technical Memorandum No 33, Nov 70. 52 p, 46 ref.

Descriptors: Shore protection, *Littoral drift, *Sands, *Sediment transport, California.
Identifiers: Heavy minerals, Epidote, Augite, Hornblende, Garnet, Zircon, *Littoral transport, *Littoral barrier, Sand analysis, Point Conception (Calif).

A study of heavy minerals on the California Coast was made at CERC as an adjunct to the Radioisotopic Sand Tracer (RIST) and the Littoral Environmental Observation (LEO) programs. Beach samples taken during various times of the year were supplemented by samples from offshore and the rivers. Heavy minerals in the 63-125 micron fraction of the samples were identified by optical techniques. Five provinces were identified: (1) a northern Hornblende province from north of Monterey Bay to Piedras Blancas Point; (2) a northern Augite Province from Piedras Blancas to Avila Beach; (3) an Epidote province from Avila Beach to Ventura; (4) a southern Augite Province from Ventura to Palos Verdes Point; and (5) a southern Hornblende Province from Point Fermin south. The ratios of the less stable augite and hornblende to the more stable garnet and zircon indicated a southward littoral transport north of Point Conception. Increase in grain sizes and in augite and hornblende content south of the input from the Ventura and Santa Clara Rivers indicated a southward net littoral transport there. Similar trends could not be found between Point Conception and Ventura. Because of possible multiple sources for augite and reversals in littoral transport, heavy minerals are not definitive indicators of littoral drift from Point Conception to Ventura. However, considering other evidence from radioisotopic tracer surveys, historical surveys and dredging projects, it is reasonable to conclude that, although Point Conception-Point Arguello may act as a partial barrier, some sand moves south and east around them. (CERC)

TRACING SAND MOVEMENT IN THE LITTORAL ZONE: PROGRESS IN THE RADIOISOTOPIC SAND TRACER (RIST) STUDY - JULY 1968-FEBRUARY 1969,
Army Coastal Engineering Research Center, Washington, D.C.
David B. Duane.
CERC Miscellaneous Paper 4-70, Aug 70. 52 p, 28 ref.

Descriptors: *Sediment transport, *Sediment distribution, *Beaches, Data processing, *Oceanography, Instrumentation.
Identifiers: Dynamic oceanography, Littoral processes, *Sediment tracers, Sediment analyses, *Hydrographic surveys, Radioisotopes, Xenon-133, Gold 198-199, Radiation detector, Cesium iodide crystals, Headlans, California.

Tagging procedures, instrumentation, field surveys and data handling techniques have been developed by the radioisotopic sand tracing study for the collection and analysis of over 12,000 bits of information per hour over a survey track of about 18,000 feet. Data obtained can be considered as nearly synoptic observations of sediment transport in a single environmental zone or in adjacent beach, surf and offshore zones. Experiments at Surf, Point Conception, Point Mugu, and Oceanside, California, used sand tagged with isotopes of xenon or gold. Data from studies in beach areas unmodified by littoral barriers indicate that the alongshore velocity of sediment transport differs from zone to zone. Transport seaward of peaking, breaking waves is less than transport on the beach face which is less than transport in the plunge and surf zone. Zone dimensions change with waves and tides. Tracing surveys confined to the foreshore of offshore zones produce data only partly indicative of transport in the zone of immediate concern to coastal engineers. Studies conducted at the site of shore structures indicate the RIST system can provide data useful in understanding the effect of such structures on sediment transport. (CERC)

Identifiers: *Beaches, Protection, *Continental shelves, Deposits, Sand, Ocean bottom sampling, Sedimentation, Degradation, Seismic waves, Reflection, Seacoast, Echo ranging, Surveying, Florida, *Shore protection, Palm Beach (Fla), Miami (Fla), Boca Ration (Fla), Geomorphology.

The Continental Shelf off SE Florida between Palm Beach and Miami was surveyed to locate and evaluate sand deposits usable for artificial beach nourishment. Survey data covered 141 square miles of that part of the Continental Shelf between 15 and 100-foot depths, and consisted of seismic reflection profiles and sediment cores from the sea floor. As beach nourishment, sand-sized sediments from the shelf off SE Florida are of marginal quality.

GEOCHEMICAL HYDROLOGY OF THE GROUNDWATER IN BATON ROUGE, LOUISIANA,
Louisiana State Univ., Baton Rouge. Dept. of Geology.
Rashid A. Khan.
Ph. D. Dissertation, Louisiana State University and Agricultural and Mechanical College, January 1971. 104 p, 17 fig, 13 tab, 47 ref, 3 append. OWRR Project A-010-LA (1).

Descriptors: *Water chemistry, *Hydrogeology, *Louisiana, *Aquifer characteristics, Groundwater movement, Aquifers, Saline water, Ion transport, Ion exchange, Chlorides, Bicarbonates, Carbonates, Sulfates, Diagenesis, Membrane processes, Magnesium, Sodium, Potassium, Geochemistry.
Identifiers: *Baton Rouge (La).

Chemical character of the groundwater in the Baton Rouge area of Louisiana is a function of several physicochemical processes, including ion exchange, filtration due to clay compaction, mineral solubility, and mixing of the waters. Chloride water is a mixture of diagenetically altered sea or estuarine water with fresh water. The chloride waters originated from the dilution of original trapped salty water by fresh waters. Sodium bicarbonate water is the result of ion exchange and membrane filtration. Membrane filtration is most active in the area of maximum land surface subsidence. The Ca and Mg bicarbonate waters formed at shallower depths, are principally due to solution of carbonate minerals. Regression analyses suggest that ionic character of the groundwater is not related to the area of supposed recharge, but to the depth of occurrence, the Mississippi River, and extensive withdrawal of water in the industrial area. Hydrochemical facies indicate that Baton Rouge fault acts as a hydrologic barrier. (Knapp-USGS)

SOME METHODS OF APPRAISING THE INTENSITY OF WATER MIGRATION OF CHEMICAL ELEMENTS, (IN RUSSIAN),
Uralskoe Territorialskoe Geologicheskoe Upravlenie (USSR).
G. A. Vostroknutov.
Doklady Akademii nauk BSSR, Vol 14, No 1, p 53-56, 1970.

Descriptors: *Chemicals, *Water properties, *Migration, Precipitation (Atmospheric), Runoff, Oxidation, Weathering, Mathematical studies.
Identifiers: *Hydrochemical balance, Sulfur oxidation, Epigenetic process, Expotentiality law.

Water migration of chemical elements may be subdivided into three mutually interlaced groups: migration from rocks, soils, atmosphere, and biosphere into waters; migration in still and flowing waters; migration from water into water basins and adjacent geospheres. The predominant mode of element migration is established on the basis of hydrochemical balance determined within the limits of a given area and time segment. Studies of the hydrochemical balance in the Ural region revealed a strong influence of oxidation of sulfides on the weathering and migration of ore-containing elements. The results were obtained by integration of several parameters including precipitation, runoff, and concentration of elements. (Wilde-Wisconsin)

Descriptors: *Diffusion, *Silica, *Sea water, Membrane processes, Laboratory tests, Methodology, Test procedures, Sediments, Oceans, Salinity, Water chemistry, Diagenesis, Sediment-water interfaces.
Identifiers: *Silica diffusion coefficient.

The diffusion coefficient of dissolved monomeric silica in seawater of 36.1% salinity has been determined at 25 deg C by the diaphragm cell method. Silica was permitted to diffuse across a porous membrane from stirred seawater of higher silica concentration into otherwise identical seawater of lower silica concentration. Two separate seawater samples were used and five individual determinations of the diffusion coefficients for silica were made on each sample. There was no significant difference between the average diffusion coefficient in the first run and that for the second run. The average deviation for the ten determinations was 2%. Recent marine sediments probably have a directional diffusional porosity of about 30%. Therefore the apparent diffusion coefficient for such systems should be about 0.3 times the value of the silica diffusion coefficient for pure seawater. (Woodard-USGS)

ıggested, when working with drug-urea-water
ns, that more than passing consideration be
to the effect or effects produced by addition
ourth component, as, for example, when an
s used to adjust pH. Data are cited which in-
that these effects are measurable and often
ctable. Solubility data for methyl salicylate
ethyl benzoate are given as functions of vary-
id, salt, and urea concentrations. These data
sent the equilibrium solubilities of the esters
various systems at 30 degrees. The solubili-
ere obtained by sampling and subsequent
nination of the ester concentration using UV
ophotometry. A mathematical model was
d which permits a quantitative evaluation of
fects in urea solutions. The theoretical calcu-
s, based on this model, were found to be in
agreement with the experimental values ob-
l for neutral and pH 1 solutions of methyl sal-
e and methyl benzoate in urea. Extension of
findings to an earlier investigation indicates
gnificant error in interpretation of solubility
a may result if these salt effects are disre-
d. (Woodard-USGS)

variant behavior can be modeled as a discon-
s time-series, composed of time-systematic
tochastic components. The stochastic com-
t is a residual of random fluctuations and
ing. The four model behavior types recog-
are constant, trend, cyclical, and oscillatory.
s illustrate and generating functions are
for each behavior. Sometimes visual observa-
lone may suffice to classify the type of time-
t behavior, but in questionable cases, one or
specific tests must be used to determine
type of behavior has been generated from
nstant parent behavior. Serial correlation
coefficients r sub k, the rank correlation tau
for confirming trends and establishing
ion, the turning points test for fluctuation
ncy, and the runs test used to detect values
or below median values, are all used to
nine into which of the four categories a time-
t behavior series may fall. Examples of the
s behaviors using actual measurements on
uckee River and a well in Nevada are given
xplanatory graphs. The behaviors are illus-
and defined by use of equations. (Yensen-

MODELING OF THE NITROGEN AND ALGAL CYCLES IN ESTUARIES,
Manhattan Coll., Bronx, N.Y. Environmental Engineering and Science Program.
R. V. Thomann, D. J. O'Connor, and D. M. Ditoro.
Proceedings, 5th International Water Pollution Research Conference, Paper III-9, July-August 1970. 14 p, 9 fig, 1 tab, 10 ref.

Descriptors: *Mathematical models, *Nitrogen cycle, *Oxidation, Ammonia, Nitrites, Oxygen, Phytoplankton, Biochemical oxygen demand, Dissolved oxygen, Estuaries, Water pollution effects, Water pollution sources, Nitrification, Algae.
Identifiers: Algal cycle, Delaware Estuary (Del-NJ), San Joaquin Delta (Calif), Steady-state models.

Two mathematical models were constructed to address the problems of nitrogen and algal cycles. The steady-state, multi-demensional model was used for analyzing nitrification and algal utilization of available nitrogen. The dynamic model incorporated the growth and death of phytoplankton and herbivorous zooplankton and the utilization of inorganic nitrogen. Application of the first model to the Delaware Estuary indicated the rate of ammonia oxidation of about 0.1/day at 20C with nitrification inhibition at DO less than 1-2 mg/l. A lower DO resulted from nitrogen oxidation. The same model applied to the Potomac Estuary indicated algal utilization of nitrates at 0.1/day at 20C. The dynamic non-linear model, applied to Sacramento-San Joaquin Delta, (Calif) adequately described the algal growth and utilization of nutrients. The net algal growth coefficient ranged up to 0.3/day during the spring. (Wild-Wisconsin)

BIOLOGICAL AND CHEMICAL STUDY OF VIRGINIA'S ESTUARIES,
Virginia Inst. of Marine Science, Gloucester Point.
Morris L. Brehmer.
In: Virginia Polytechnic Institute and State University Water Resources Research Center Bulletin 40, p 121-125, December 1970. 5 p. OWRR Project B-003-VA.

Descriptors: *Estuaries, *Virginia, *Water quality, *Reviews, Surveys, Dissolved oxygen, Salinity, Nutrients, Eutrophication, Ecology, Saline water intrusion.
Identifiers: Chesapeake Bay.

Virginia's estuaries are dynamic systems characterized by high levels of instability. The reaches near Chesapeake Bay are the most stable since they are least affected by variations in freshwater inflow from the tidal river. The middle reach encompasses the gradient zone in which the water may be completely fresh during extremely high discharge periods and approach 50% seawater during drought conditions. The location of the transition zone between fresh and salt water also shifts with discharge levels and may vary as much as 20 miles upstream and downstream from the 'average' point within a season. Dissolved oxygen levels in Virginia's three major estuarine systems did not approach extremely low values during the study period. (See also W71-05555) (Knapp-USGS)

DEPOSITIONAL PROCESSES AND PRODUCTS IN THE DELTAIC ENVIRONMENT,
Louisiana State Univ., Baton Rouge.
James P. Morgan.
In: Deltaic Sedimentation, Modern and Ancient, Society of Economic Paleontologists and Mineralogists Special Publication No 15, p 31-47, November 1970. 17 p, 13 fig, 2 tab, 34 ref.

Descriptors: *Deltas, *Sedimentation, *Sedimentary structures, Mississippi River, Deposition (Sediments), Sediment transport, Bed load, Suspended load, Paleohydrology, Sedimentology, Stratigraphy, Reviews.
Identifiers: *Mississippi Delta, *Ganges-Brahmaputra Delta, *Mekong Delta.

Factors controlling depositional processes and products are analyzed for three of the world's major river-delta systems; the Mississippi, Ganges-Brahmaputra, and Mekong. These three river

systems have deltas with varied geomorphic form which reflects differences in depositional processes. Four basic factors control and influence delta formation: (1) river regime; (2) coastal processes; (3) structural behavior and the relation of sea level to the depositional site; and (4) climatic factors, particularly those that affect vegetation within the delta. The Mississippi delta area is characterized by rapid subsidence, primarily through sediment compaction, and its deposits are subject only to minor modification by coastal processes. The Ganges-Brahmaputra delta is also tectonically controlled but by Quaternary faulting as well as by subsidence through sediment compaction. The Mekong has created a single delta system which has prograded across an essentially rigid platform. Contemporaneously, coastal processes (tides, waves, and currents) have reworked the delta front, creating sand beaches which merge laterally to form widespread sheet sands in the deltaic plain. STRATIGRAPHY AND HISTORY OF THE HOLOCENE SEDIMENTS IN THE SABINE-HIGH ISLAND AREA, GULF OF MEXICO,
Mobil Research and Development Corp., Dallas, Tex. Field Research Lab.
Henry F. Nelson, and Ellis E. Bray.
In: Deltaic Sedimentation, Modern and Ancient, Society of Economic Paleontologists and Mineralogists Special Publication No 15, p 48-77, November 1970. 30 p, 13 fig, 5 plate, 2 tab, 36 ref, append.

Descriptors: *Deltas, *Gulf of Mexico, *Sedimentation, *Sedimentary structures, Deposition (Sediments), Sediment transport, Bed load, Suspended load, Paleohydrology, Sedimentology, Stratigraphy, Coastal plains.
Identifiers: *Sabine River (La), *Calcasieu River (La).

The Holocene sediments on the northwest shelf of the Gulf of Mexico were formed in interdeltaic as well as deltaic areas during the postglacial rise of the sea and during its stillstand since it reached its present level. In an interdeltaic area of relatively minor sedimentation off the Texas coast, the Sabine-High Island area, 11 lithotypes were defined during a three-dimensional study of the Holocene sediments. With the exception of one type, peat, all are made up of various combinations of three major sediment components, clay, quartz sand, and shells. These sediments were deposited as five lithofacies on an eroded Pleistocene surface that was crossed by a major topographic feature, the channel of the Sabine and Calcasieu Rivers. The three most important factors controlling the distribution of sediments are topography, variations in the rate of rise of the sea, and currents. (Knapp-USGS)
W71-05573

THE MISSISSIPPI DELTA COMPLEX,
Esso Production Research Co., Houston, Tex.
H. R. Gould.
In: Deltaic Sedimentation, Modern and Ancient, Society of Economic Paleontologists and Mineralogists Special Publication No 15, p 3-30 November 1970. 28 p, 25 fig, 1 tab, 14 ref.

Descriptors: *Deltas, *Mississippi River, *Sedimentation, *Sedimentary structures, Deposition (Sediments), Sediment transport, Bed load, Suspended load, Paleohydrology, Sedimentology, Stratigraphy, Reviews.
Identifiers: *Mississippi Delta.

The Mississippi delta complex is one of the largest and probably best known of the world's major delta systems. Its subaerial surface, the Mississippi deltaic plain, extends from an apex at the mouth of the Mississippi alluvial valley to a base of 200 miles along the Louisiana coast. Underlying this plain and the adjacent continental shelf and slope is a huge mass of late Quaternary river mouth deposits which makes up the deltaic complex. These sediments occupy a seaward deepening troughlike depression in the underlying surface that developed contemporaneously with deposition and which is localized to the depositional area. Downwarping of this segment of the continental margin, together with the eustatic rise in sea level during late Quaternary time, was sufficient to accommodate the great thickness of deposits which reaches a known maximum of about 1,000 feet underlying the continental shelf at the seaward limit of control. Both the shallow-water deltas and the active deep-water birdfoot delta are characterized by distinctive facies which are readily recognized by their lithologic, faunal, and geometric features. (Knapp-USGS)

HOLOCENE GUADALUPE DELTA OF TEXAS GULF COAST,
West Virginia Univ., Morgantown, and Campbell Coll. Buies Creek, N.C., and Esso Standard Libya, Inc., Tripoli.
Alan C. Donaldson, Richard H. Martin, and William H. Kanes.
In: Deltaic Sedimentation, Modern and Ancient, Society of Economic Paleontologists and Mineralogists Special Publication No 15, p 107-137, November 1970. 31 p, 18 fig, 4 tab, 35 ref, 1 plate.

Descriptors: *Deltas, *Sedimentation, *Texas, *Gulf of Mexico, *Sedimentary structures, Deposition (Sediments), Sediment transport, Bed load, Suspended load, Sedimentology, Stratigraphy, Coastal Plains.
Identifiers: *Guadalupe River Delta (Tex).

The Holocene delta of the Guadalupe River is slowly prograding into San Antonio Bay of the Texas Gulf Coast. The delta is part of a modern complex of lagoonal and deltaic sediments deposited along a shoreline dominated by barrier islands. The river deposits its load in a shallow, relatively quiet body of water, and as the delta progrades into increasingly shallow water, distributary channels have become deeper than the present bay floor. Sediments are clay and silty clay except for the basal part of the distributary-channel and delta-front deposits, which are fine-grained sand, silty sand, or silt. Where the delta is birdfoot, the delta-front deposits are shoestring (bar-finger) sands. The overall configuration of the Guadalupe delta is birdfoot. Characteristics which make the Guadalupe delta a distinctive model are: (1) the river discharge and load overwhelm the weaker currents and waves of the bay, (2) deposition is in such a shallow body of water that waves can rework the bay sediments, (3) the river channels are deeper than the present bay floor, (4) the bay is becoming progressively shallower as the delta progrades, and (5) growth is by development of successive subdeltas, most of which are presently deteriorating. THE SEDIMENTARY FRAMEWORK OF MORETON BAY, QUEENSLAND,
ydney Univ. (Australia). Dept. of Geology and Geophysics.
V. G. H. Maxwell.
Australian Journal of Marine and Freshwater Research, Vol 21, No 2, p 71-88, December 1970. p, 11 fig, 17 ref.

Descriptors: *Sedimentation, *Provenance, *Bays, Sand bars, Dunes, Reefs, Sedimentary structures, Stratigraphy, Carbonate rocks, Sands, Deposition (Sediments), Sediment transport.
Identifiers: *Moreton Bay (Queensland), *Australia.

Moreton Bay occupies an area of 540 sq miles on he south-east Queensland (Australia) shelf, and is bordered on the east by high barrier islands. It is livisible into a deep northern sector and a narower southern region with numerous small sand slands. Vigorous tidal activity has resulted in tidal leltas and sand ridges on the northern and eastern nargins. The main sedimentary pattern in the Bay s determined by the Mesozoic and Cainozoic histoy of the region, particularly the tectonic and eustatic variation. At the present time, the main sediment source is from the shelf and barrier islands where ancient dune deposits are feeding the Bay. The main contribution from the western land mass s mud, which is largely restricted to the western part of the Bay. Relict coral reefs and existing coral communities contribute to a carbonate facies which is very restricted in distribution. The main movement of sediment is by tidal currents which are most effective on the eastern side of the Bay where the sediment is predominantly quartz sand. (Knapp-USGS)

03. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

METHODOLOGICAL ASPECTS OF TECHNICO-ECONOMIC PARAMETERS OF NUCLEAR DESALINATION PLANTS,
Gosudarstvennyi Komitet po Ispolzovaniyu Atomnoi Energii SSSR, Moscow.
Yu I. Koryakin, A. A. Loginov, and V. A. Chernyaev.
Desalination, Vol 7, p 323-342, 1970. 3 fig, 6 ref.

Descriptors: *Desalination plants, *Financial analysis, *Nuclear powerplants, *Cost analysis, Economics, Methodology, Technology, Thermal power, Heat, Distillation, Cost comparisons.
Identifiers: *Power and water production, Ginter triangle.

Technical and economic parameters of nuclear desalination plants are outlined. The suggested methodology is based on the category of 'evaluated expenditure,' widely used in the USSR in different sectors of national economy. The analysis of existing methods of appraisal of costs of a plant producing electricity and heat permitted a formulation of a generalized method. The latter eliminates shortcomings of other approaches and is considered to be the most advantageous; it presents a correct distribution of costs of the nuclear total expenditure of a power station. (Wilde-Wisconsin)

L. S. Herbert, and D. H. Moffatt.
Australian Water Resources Council Research Project No 68/6, 1970. 142 p, 8 fig, 15 plate, 2 tab.

Descriptors: *Desalination, *Reviews, *Arid lands, *Water costs, Distillation, Reverse osmosis, Electrodialysis, Ion exchange, Water quality, Water treatment.
Identifiers: *Australia, *Desalination (Australia).

Detailed information was obtained on costs and aspects of operation during visits to 12 desalination plants in Australia. Existing, proposed and formerly operating plants are listed. A summary is given of the main design, operational and cost data relating to the 8 plants surveyed for which detailed information was available. Some plants are being used below their design capacity because the water is not required during some part of the year, while others do not achieve design capacity because of operational difficulties in heat supply, excessive downtime for scale removal, major mechanical problems, etc. Of the plants surveyed, larger plants appear to operate more satisfactorily than smaller plants. Those plants designed for, and operating on weakly saline waters, presented fewer problems in operation than plants designed for, and operating on sea water. (Knapp-USGS)

COMMUNITY WATER SUPPLY IN DEVELOPING COUNTRIES: A QUARTER-CENTURY OF UNITED STATES ASSISTANCE,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
Frederick E. McJunkin.
Department of State Agency for International Development, Washington, DC, 1969. 86 p. Supported by Office of International Health, United States Public Health Service.

Descriptors: *Water supply, *Foreign countries, *Federal government, *Sanitation, Reviews, *Training, *Foreign research, Regions, *Geographical regions, *Public health, *Economic impact, Social impact.
Identifiers: *Foreign aid, Brazil, East Pakistan, Thailand, Yemen.

The history and status of United States technical and capital assistance (a billion dollars since 1942) for water supply in developing countries are reviewed by region and country, including its context as part of foreign aid generally and its growth from early days (1942) in Latin America to a global program and an important element of multilateral programs. The essential role of water supply in developing countries (why foreign aid for water supply) is reviewed with particular attention to health (500 million water-related illnesses annually), economic development, nutrition, population control, and political and social development. Current deficiencies and needs are outlined by region. Six projects from the hundreds undertaken are highlighted as examples of educational assistance (Regional School of Sanitary Engineering for Central America), development and strengthening of a national water supply program (Brazil), institution-building (Department of Public Health Engineering in East Pakistan), technological development (new handpump for wells), capital assistance (John F. Kennedy Memorial Water System in Yemen), and rural water supply (Thailand). Lessons and observations based on a quarter-century of experience include: (1) community water supplies in developing countries are still generally inadequate despite recent progress; (2) community water supplies are essential investments for community development and sustained economic growth, they encourage progressive forces, emphasize human progress, and stimulate self-help concepts; (3) a self-liquidating water supply system is a feasible goal for urban communities of even the poorest countries; (4) well-conceived, well-engineered water supply projects can attract international financing; (5) preventive health programs that ignore water supply are invariably failures; (6) deficiencies in personnel and in institutions are currently the critical factors in development of community water supplies, not technology and probably not capital--a realistic program for improvement will require attention to institution building and personnel training; (7) the major accomplishment of the Community Water Supply Program is not hardware but the progress to date in establishment or strengthening of water supply institutions; however technical assistance must be continued until these have ripened to full maturity.

3C. Use of Water of Impaired Quality

HYDROLOGICAL PROBLEMS RELATED TO THE USE OF SALINE WATERS,
Council of Scientific and Industrial Research, New Delhi (India).
S. Banerji.
Nature and Resources, Vol V, No 2, p 13-15, June 1969.

Descriptors: *Saline water, *Water utilization, *Water resources development, *Water quality, *Planning, United Nations, Foreign countries, Research and development, Salinity, Water types, Hydrologic aspects, Sea water, Surface waters, Subsurface waters, Aquifers, Fresh water, Reclamation, Water policy.

A panel of experts from various United Nations agencies met to discuss problems related to use of saline waters. The panel identified types of hydrological processes producing water salinity of surface and subsurface waters in both inland and coastal or marine areas. Categories of water salinity were established, rating waters as fresh, mineralized, slightly saline, moderately saline, saline, oceanic, and briny according to proportions of total dissolved salts present. Uses of saline water having a hydrological impact were agriculture and fisheries, urban and rural water supplies, industrial use, navigation, and demineralization. The panel drafted questionnaires to be sent to countries using saline water to elicit more information on the use of saline waters and the handling of related problems. Effects produced by upstream development of rivers and use of fresh waters were listed, including effects of irrigation, changing land use, evapotranspiration, over-extraction of groundwater, reclamation of coastal areas, sea-water intrusion, decreased river flow, improvement of navigational facilities and development of oil fields. The panel will prepare a bibliography of works dealing with saline water, make an inventory of saline waters potentially available for use, prepare maps of such waters, and disseminate all findings of the panel. PRODUCTION, CRUDE PROTEIN, AND USE OF 11 IRRIGATED GRASSES AND ALFALFA-GRASS COMBINATIONS ON CLAY SOILS IN WESTERN SOUTH DAKOTA,
South Dakota State Univ., Brookings. Dept. of Range Management.
James R. Johnson, and James T. Nichols.
South Dakota Agricultural Experiment Station, Bulletin 555, April 1969. 15 p, 7 tab, 3 fig, 22 ref.

Descriptors: *Crop production, *Crop response, *Proteins, *Grasses, *Fertilization, Soil-water-plant relationships, Cutting management, Alfalfa, Fertility, Nitrogen, Growth rates, Persistence, Economic prediction, Grazing, Wheatgrasses, Range management, Watershed management, Seasonal, Clays, South Dakota, Great Plains.
Identifiers: *Irrigated grasses, Semiarid lands.

To determine regional suitability based on production, crude protein percentage, season of growth, and persistence under irrigation, 11 grasses were grown on clay soils in 3 ways: (1) without supplemental fertility; (2) with 100 pounds of nitrogen per acre annually; and (3) in association with alfalfa. Data were collected for 4 seasons. Average fertilized grass yield of 6,205 pounds per acre. Grass from the alfalfa-grass combinations almost equaled non-fertilized grass production. Alfalfa-grass combination provided the best production distribution for multiple cuttings or growing season grazing. Fertilized grass gave the largest single forage cutting. Non-fertilized grass could not economically compete with other irrigated crops. Nitrogen treatment enhanced protein percentage. Earliest grazing could be made by crested wheatgrass, followed by other wheatgrasses. This information is useful for optimal range and watershed management in the Northern Great Plains. (Popkin-Arizona)

SELECTED CHARACTERISTICS OF REPRESENTATIVE IRRIGATED AND DRY-LAND FARMS AND RANCHES IN THE BELLE FOURCHE AREA,
Economic Research Service, Brookings, S. Dak.
Charles C. Micheel.

nded in part by the U.S. Department of Agricul-
re, Economic Research Service, Farm Produc-
n Economics Division. South Dakota Agricul-
ral Experiment Station, Bulletin 556, May 1969.
p, 24 tab, 2 fig, 5 ref.

escriptors: *Irrigated land, *Dry farming,
)perating costs, *Irrigation programs, *Compara-
e productivity, Livestock, Value, Employment,
ices, Hay, Oats, Barley, Corn (Field), Farm
anagement, South Dakota.
entifiers: Belle Fourche Irrigation Project,
miarid lands.

ta for 1963 from farms and ranches on the Belle
urche Irrigation Project and surrounding dry-
ds in northwestern western South Dakota are
d to describe and compare dryland and irrigated
its. Livestock, mainly beef cattle and sheep, are
sed on most units. Net worth of irrigated farms
erage $20,130 on 240-acre units to $35,675 on
0-acre units. Younger operators are on larger
its. One-third of the irrigation operators had
rt-time off-farm jobs earning an average of
,700 per year, and 10% of the wives had year-
und full-time earnings of $3,100. Fewer dryland
erators or wives had off-farm work. Irrigation
erators listed 'lack of rain' as a major problem.
th groups listed 'low prices and high costs' as a
condary problem. About 8% of the hay, 1% of
e barley, 10% of the oats, and 24% of the corn
sed on irrigated units was sold for cash. Dryland
d was not sold for cash. Little interdependence
tween irrigation and dryland operators was
nd, except where operators have some irrigated
pland and some rangeland, as was the case in 6
the 69 sample units studied. Tables summarize
oduction, cost, cultural practices, and size and
tribution of agricultural units. (Popkin-Arizona)

ficiencies, *Comparative productivity, *Sprin-
r irrigation, Farm management, Fertilization,
eds, Production, Furrow irrigation, Labor,
tatoes, Wyoming.
entifiers: *Circular sprinklers, Semiarid lands.

erviews of 5 potato growers in southeastern
yoming, who produced 62% of the total 1968
reage, were used to obtain physical and financial
ormation for crop production under circular
inklers. Operators used 13 man hours and 3.2
ctor hours to produce an acre of potatoes. Large
ctors and machinery on large fields and
nimum tillage techniques were used. Seeding fer-
zation, and water application rates conformed
h research recommendations. Total production
sts average $227 per acre for an expected 250
ndredweight, which includes $28 for labor, $168
other cash costs, and $31 for noncash items on
expected yield of 250 sacks at 91 cents per sack.
is compares to a 1966-furrow irrigation cost of
22 per acre, or na adjusted 1968 per acre cost of
58. Potato growers who use circular sprinklers in
yoming produce larger acreages than average,
highly efficient in operations, and are skilled in
oduction techniques. Tables show physical and
ancial data of circular sprinkler and furrow ir-
ation. (Popkin-Arizona).

WATER REQUIREMENTS OF SUGARCANE UNDER IRRIGATION IN LAJAS VALLEY, PUERTO RICO,
Puerto Rico Univ., Mayaguez. Agricultural Experiment Station.
Roberto Vazquez.
Available from NTIS as PB-197 992, $3.00 in paper copy, $0.95 in microfiche. Puerto Rico University Agricultural Experiment Station Bulletin 224 (WRRI-FR-71-5) July 1970. 36 p, 4 fig, 15 tab, 9 ref. OWRR Project A-005-PR (1).

Descriptors: *Irrigation, *Sugarcane, *Puerto Rico, *Water requirements, Testing, Experimental forms, Methodology, Soil moisture, Fertilizers, Soil treatment, Irrigation efficiency, Rates of applications, Crop response, Crop production, Soil-water-plant relationships.
Identifiers: *Lajas Valley (Puerto Rico).

Field experiments were conducted in Puerto Rico at the Lajas Substation to determine optimum soil moisture conditions necessary to produce maximum sugarcane and sugar yields. Twenty irrigation regimes were tested. Some of the plots were irrigated frequently and others were irrigated less frequently in the active root zone throughout the growing period. Nitrogen fertilizer treatments were tested at the rate of 200 and 300 pounds per acre per crop. Data were taken for a 13-month plant cane and two 12-month ratoons of sugarcane. The plant cane used more water than the ratoon crop. The mean consumptive use per day was 0.160 inch for plant cane and 0.154 inch for ratoon in the frequently irrigated plots throughout the growing period. The average of the combined yields of a plant cane and two ratoons were 73.67 tons of sugarcane and 7.80 tons of sugar per acre in the frequently irrigated plots, and 59.37 tons of sugar cane and 6.40 tons of sugar per acre in the less frequently irrigated plots. There was no significant difference in yields between plots fertilized at rates of 200 and 300 pounds of nitrogen per acre per crop. (Woodard-USGS)

L. F. Abell, and C. J. Brouwer.
International Institute for Land Reclamation and Improvement, Wageningen, The Netherlands, 1970. 41 p.

Descriptors: *Bibliographies, *Cotton, *Irrigation, *Fertilization, *Economics, Abstracts, Crop production, Crop response, Plant growth, Planting management, Consumptive use, Water requirements, Arid lands, Water conservation.
Identifiers: *Irrigated crops.

Approximately 240 works concerned with consumptive use, or irrigation and water requirements of cotton are listed, some with a brief statement of content. Cotton is a major arid-land crop. Only selected literature published in English, French and German, issued for 1955 to 1969 is included. Bibliographies include masters' theses, books, journals, progress reports, and work done at state agricultural experiment stations. The compilation is divided into sections on irrigation and water requirement, interrelation of irrigation and fertilization, economic aspects of irrigation, bibliographies and reviews on irrigation and water requirement, abstracting journals, and abstracts sections in journals containing pertinent literature. Available from NTIS as PB-197 881, $3.00 in paper copy, $0.95 in microfiche. Idaho University Water Resources Research Institute Information Bulletin No 5, September 1970. 42 p, 3 plate, 4 tab, 8 ref. OWRR Project B-014-IDA (4).

Descriptors: *Water level fluctuations, *Wild rivers, *Reservoir operation, *Recreation, *Environment, Scenery, Wildlife, Fishing, Boating, Wild River Act, Aesthetics.
Identifiers: *Reservoir effects.

The operation of Dworshak Dam, located at the mouth of the North Fork of Idaho's Clearwater River, will result in fluctuations of water level and water quality. A study was made to assess the potential environmental effects on the lower Clearwater River. Beaver, mink, muskrat, otter, weasels and racoons utilize the banks of the river. Upland game such as quail, pheasants, and chukars are present in relatively abundant numbers. Fishing effort on the lower Clearwater is primarily for steelhead and smallmouth bass. There are 33 establishments doing business along the 35.9 mile reach of the lower Clearwater River. Approximately 1.82 billion gallons of water are withdrawn annually from Clearwater River or river subsurface flow to supply the municipal and industrial needs of Lewiston and four small villages. There are a number of archaeological sites along the lower Clearwater River. Six such sites considered to be significant are located between Spalding and Ahsahka. The potential effects of fluctuations of river level and water quality on fisheries, recreation, vegetation, wildlife, aesthetics, and commercial and industrial establishments are briefly discussed. Descriptors: *Water management (Applied), *Automatic control, Irrigation, Water distribution (Applied), Telemetry, Waver levels, California, Automation, Arizona, Computer programs, Pilot plants, Canals, Reservoirs, Rivers, Streams.
Identifiers: Servomechanisms, Salt River Project (Ariz), Sacramento Control Center (Calif).

The need to control flow throughout large irrigation projects and their watershed sources, sometimes bridging national boundaries, is bringing automation to water management. Automated systems offer integrated unit control when size precludes regulation by conventional methods. This technology will reach the individual farm level as costs drop and application techniques grow. There are many degrees of sophistication in automation; two methods of supervisory control are now in use. In one the operators do the decision-making based on information provided by the supervisory control system. The second method involved decision-making by a central computer; operation is preprogrammed and the operator's main task is to translate to the computer changing orders for water delivery or emergency situations. A technique long used in industrial engineering for over-all system performance is a pilot plant. One program goal was to evaluate the microdigit water level encoder. It can measure water level in canals, rivers, steams, reservoirs or the position of water control gates, displacement to 0.01 foot accuracy, and gives direct digital conversion. (Jones-Wisconsin)

ARTIFICIAL GROUNDWATER RECHARGE, WET WALNUT CREEK, CENTRAL KANSAS,
Geological Survey, Lawrence, Kans.
J. B. Gillespie, D. W. Green, and S. E. Slagle.
Kansas Water Resources Board Progress Report No 2, January 1970. 28 p, 15 fig, 2 tab, 1 ref, 2 append.

Descriptors: *Artificial recharge, *Pit recharge, *Alluvium, *Kansas, Water spreading, On-site tests, Infiltration, Percolation, Alluvial channels, Surface-groundwater relationships, Aquifers.
Identifiers: *Wet Walnut Creek (Kans).

The capability to artificially recharge the alluvial aquifer underlying Wet Walnut Creek valley, central Kansas, was tested at two sites--one an alluvial slope near the edge of the valley and the other a shallow tributary channel with ephemeral flow. Most of the site-development work is finished except the dam for pond 1 at the tributary-channel site. At the alluvial-slope site, after water pumped from wells has been ponded for several days, the infiltration rate is about 0.5 foot per day. The infiltrated water is perched above a zone of silty clay from where it percolates to the aquifer. At the tributary-channel site, the infiltration rates vary with different channel-bottom conditions. (Knapp-USGS)

INTERPRETATION OF ELECTRIC AND GAMMA RAY LOGS IN WATER WELLS,
Gearhart-Owen Industries, Inc., Fort Worth, Tex.
Hubert Guyod.
Well Log Analysts, January-March 1966, p 2-16, 13 fig, 48 ref.

Descriptors: *Logging (Recording), *Water wells, *Electrical well logging, *Radioactive logging, Drilling, Oil industry, Aquifer characteristics, Groundwater, Geochemistry, Water quality.
Identifiers: *Well log interpretation, Clean granular acquifers, Clayey granular aquifers, Fractured aquifers, Complex aquifers, Dense formations, Clay formations, Water salinity estimation, Porosity and permeability estimation, Special log applicability.

A typical inexpensive logging program for water wells consists of a Normal of single-electrode resistivity, the SP and, sometimes, gamma ray measurements. Some of the principles underlying the analysis of these logs are reviewed. The usual logging situations are classified into three groups and simple interpretation procedures are outlined for each. Much useful information is provided by these records, especially when they are supplemented by the bit penetration rate and other data. The logs can solve many common groundwater problems. Those, and the ones that they cannot solve, are reviewed. (Campbell-NWWA)

Descriptors: *Water wells, *Municipal wells, Wisconsin.
Identifiers: Closed-circuit television, Gravel pack well, Water well service equipment, Well screen encrustations.

A closed-circuit television system was used to make a visual probe of a problem well for city of LaCrosse, Wisconsin. The resulting diagnosis of condition of well made possible an economic salvaging operation which completely restored well to normal production. It was possible not only to observe ruptured or encrusted areas, but also to estimate degree of efficiency of mechanical brushing or cleaning operations, and whether such procedures had been worthwhile. The city of LaCrosse salvaged a unit well station worth an esti-

nated $27,000.00 at a cost of less than $10,000.00.

his report discusses in considerable detail several roblems pertaining to the interpretation of electri-l and radioactive well logs in groundwater ydrology. Emphasis has been placed upon situa-ons in which interpretation departs from the prac-ces common in petroleum engineering. Certain terpretive methods of the oil industry are demon-rated to be unsatisfactory for hydrologic pur-oses, and certain other methods, which have not een commonly used in the oil industry are recom-ended for use in groundwater hydrology. For all ethods, an effort has been made to analyze the in-rpretive methods in terms of underlying theory, an understanding of theory is superior to any emorized set of rules or principles in analyzing e data of well logging. Descriptors: *Rainfall-Runoff relationships, *Small watersheds, Basins, Hydrographs, Runoff, Storm runoff, Surface, Time lag, Time of concentration, Unit hydrographs.

A small rural watershed in New Jersey is being studied for changes in hydrological characteristics during suburban development. Two stream gaging stations and two recording precipitation gages have been established in the area. During the phase covered in this report, regression models for the hydrological properties have been derived for the undeveloped basin. A standard unit hydrograph has also been established for this period. Monitoring of water quality has been initiated recently. The study will be continued during and after development.

A PRELIMINARY STUDY OF THE RELATIONSHIPS BETWEEN STREAM WATER QUALITY AND WATERSHED CHARACTERISTICS FOR THE TRUCKEE RIVER,
Nevada Univ., Reno. Center for Water Resources Research.
R. J. Morris, C. M. Skau, and V. Vitale.
Available from NTIS as PB-197 883, $3.00 in paper copy, $0.95 in microfiche. Nevada University Desert Research Institute Report, September 1970. 14 p, 3 fig, 4 tab, 9 ref, append. OWRR Project A-033-NEV (1).

Descriptors: *Water quality, *Surface waters, *Watersheds (Basins), *Nevada, *California, Environmental effects, Chemical analysis, Streamflow, Runoff, Topography, Vegetation, Land use, Nitrogen, Phosphates, Boron, Data collections.
Identifiers: *Truckee River Basin (Calif. and Nev).

Water quality along the Truckee River between Lakes Tahoe and Pyramid in northeast California and northwest Nevada was investigated. The six major sampling sites defined five major watersheds along the Truckee River between the outlet dam at Lake Tahoe and the inlet to Pyramid Lake at Nixon. Each watershed was characterized by: (1) area; (2) percentage area logged from 1959 through 1968; (3) percentage area burned from 1959 through 1968; (4) percentage area covered by paved and dirt roads; (5) soil-type percentage for each of eight types common to the area; and (6) vegetation of land-use percentage for each of twelve kinds found in the entire Truckee Watershed. Results of chemical analyses for nitrate and organic nitrogen, phosphate, and boron are tabulated. The overall levels of nitrogen and phosphate are comparatively low from Tahoe Dam to Boynton Lake (just above the Sewage Treatment Plant at Reno). The levels fluctuate around that separating oligotrophic and eutropic conditions, commonly taken as 0.1 mg/liter for nitrogen and 0.01 mg/liter for phosphate. Boron concentrations ranged from .03 mg/liter below verdi to 3.18 mg/liter at Steamboat above Sewage Treatment Plant. (Woodard-USGS)

GC DETERMINATION OF SOLUTES BY MULTIPLE PHASE EQUILIBRATION,
Chevron Oil Field Research Co., La Habra, Calif.
Clayton McAullife.
Chemical Technology, Vol 1, No 1, p 46-51, January 1971. 6 p, 8 fig, 2 tab, 10 ref.

Descriptors: Water pollution sources, *Oily water, *Chemical analysis, Methodology, Test procedures, Carbon, *Solutes, Solubility, Phase diagrams, Chemical properties, Equations, Solvents, Mixing, Solvent extractions, Equilibrium, *Gas chromatography, Laboratory tests, *Pollutant identification, Analytical techniques, Oil wastes.
Identifiers: *Hydrocarbons, Oil pollution.

Multiple phase equilibration is exemplified by the analysis of hydrocarbons dissolved in water. The associated technique and data manipulation, which are detailed, have implications for a diversity of other applications. These include estimation of distribution coefficients, Henry's law constants, vapor pressure, solubility, and several related thermodynamic parameters. The method is based on the demonstration that analysis of only one phase after two successive phase equilibriums gives all necessary data. Water containing the hydrocarbons dissolved from crude oil was analyzed. The first-equilibration chromatogram shows all the hydrocarbons through eight carbon atoms normally found in crude oils. As predicted, the first equilibration removed over 96% of the alkanes, leaving aromatic hydrocarbons and about 10% of the cycloalkanes. The third equilibration chromatogram shows only aromatic hydrocarbons. (Woodard-USGS)

A PRELIMINARY ANALYSIS OF THE EFFECTS OF URBANIZATION ON WATER QUALITY,
Regional Science Research Inst., Philadelphia, Pa.
Tatsuhiko Kawashima, Thomas R. Hammer, and Robert E. Coughlin.
Pennsylvania Regional Science Research Institute Working Paper, March 1970. 44 p, 7 fig, 3 tab, 3 append. FWQA Grant No. 16090 DYX.

Descriptors: *Urbanization, *Water quality, *Pennsylvania, *Hydrologic data, *Chemical analysis, Surface waters, Construction, Excavation, Environmental effects, Water properties, Streams, Water analysis, Water pollution, Data collections, Water chemistry, Statistical methods, Regression analysis, Variability, Correlation analysis.
Identifiers: *Urbanization-water quality relationships, *Philadelphia (Penn), *Urban hydrology.

The hydrologic effects of urbanization were studied in the Philadelphia metropolitan area. Land uses, in combination with topographic and other natural features, affect water quality characteristics, streamflow regimen, and channel morphology. Approximately 80 watersheds, 1 to 6 miles in area were sampled. These watersheds vary in development from completely rural to completely urbanized. The water samples were collected from 58 streams during a two-day period in September 1969, at a time when there had been no rainfall in the region for several weeks. Thus, the samples were taken to represent water quality conditions at base flow. The results obtained in the analyses of variance for the categorization by industrial density versus the categorization by residential density are strikingly different. For the industrial density categorization, the null hypothesis (of equality of mean concentrations for the High, Medium and Low densities) was rejected at the 1% level of significance for 10 of the 21 chemicals, and at the 5% level of significance for four additional chemicals. On the other hand, for the categorization by residential density, the null hypothesis was rejected at the 5% level for only one chemical, Si02. (Woodard-USGS)

DETERMINATION OF ORGANIC- AND CARBONATE-CARBON IN FRESHWATER LAKE SEDIMENTS BY A MICROCOMBUSTION PROCEDURE,
Wisconsin Univ., Madison. Dept. of Soil Science.
J. G. Konrad, G. Chesters, and D. R. Keeney.
Journal of Thermal Analysis, Vol 2, p 199-208, 1970. 5 fig, 2 tab, 13 ref.

Descriptors: *Analytical techniques, *Carbon, *Sediments, Lakes, Differential thermal analysis, Wisconsin, Analysis.
Identifiers: *Microcombustion procedure, Wisconsin lakes.

The total, organic, and carbonate carbon are determined in sediments of freshwater lakes by a new microcombustion procedure. The content of organic carbon is obtained by combustion of the sample at 650C and that of total carbon at 950C; the content of carbonate carbon is calculated as the difference. The method was evaluated by differential thermal analysis of 28 samples of sediments from lakes of Wisconsin. In addition, carbonate minerals including aragonite, calcite, dolomite, and their mixtures were analyzed by both procedures. The differential thermal analysis was adapted to identify dolomite. The described method eliminates the difficulties encountered by wet oxidation methods in analyses of sediments enriched in iron, manganese, sulfur, and carbonates. (Wilde-Wisconsin)

Descriptors: *Coliforms, *Bacteria, *E. coli, *Farm wastes, Domestic wastes, *Temperature, Cattle, Hog, Sheep, Poultry, Membrane filters, Variability, Water pollution, Surface drainage.
Identifiers: Detection, Enumeration, IMViC, BALB, EC broth procedure, MPN test, Biochemical tests, Correlation.

This investigation examined the reactions of 4512 human, 2339 livestock, and 1896 poultry coliform strains isolated from 43 human, 32 livestock, and 28 poultry fecal samples. The EC procedure showed a 96.3 percent positive correlation and the BALB procedure a 95.3 percent correlation with the coliforms from fecal sources. These findings suggest that the presence of EC or BALB positive coliform strains in water or wastes indicate relatively recent fecal pollution. An occasional shift in percent positive correlation of the elevated temperature test for three human samples during a period of one to three years was noted. The biochemical tests comprising the IMViC typing classification are cumbersome and do not present as close a correlation with fecal origins of the coliform group as other procedures. In view of the excellant reliability of either the EC or BALB test for fecal coliform bacteria, and taking into account the saving in time and effort, the elevated temperature procedure seems to be the method of choice. THE INFLUENCE OF FEED ADDITIVES ON THE BIOCHEMICAL OXYGEN DEMAND ANALYSIS FOR SWINE WASTES,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering.
John David Ariail.
Master of Science Thesis, 1970. 72 p, 12 fig, 44 ref. OWRR Project A-048-NC (1).

Descriptors: *Farm wastes, *Hogs, *Lagoons, *Biochemical oxygen demand, Chemical oxygen demand, Water properties, Copper, Zinc, Wastes, Lagoons, Manure, Waste water treatment, Waste identification.
Identifiers: *Swine wastes, Swine feces, Chlorotetracycline, Fecal streptococcus.

The influence of feed antibiotic, chlorotetracycline, copper and zinc concentrations and sample dilution upon the standard 5-day biochemical oxygen demand (BOD5) analysis was investigated with swine feces, lagoon influent and lagoon effluent. The swine-growing center utilized for sample collection included a confinement facility with concrete floors that were washed daily and an unaerated overflow lagoon. The data indicated the mean COD/TS ratio for fresh swine feces to be 1.08 grams per gram, the BOD5/TS ratio to have a mean of 0.33 grams per gram, and the VS/TS ratio to have a mean of 0.82. This study indicated that for a 100 lb. hog, the daily COD in the waste was 0.64 pounds; BOD 0.31 pounds; total solids 0.48 pounds and volatile solids 0.33 pounds. The membrane filter technique outlined in Standard Methods for the determination of the fecal streptococcus content of swine wastes was superior to the membrane filter technique utilizing KF broth. MARINE CHEMICAL POLLUTANTS (METHODS OF STUDY AND RESULTS), (FRENCH),
Centre d'Etudes et de recherches de Biologie et d'Oceanographie Medicale, Nice (France).
M. Aubert, J. Aubert, S. Daniel, and B. Donnier.
English Summaries. Revue Internationale D'Oceanographie Medicale, Vol 17, p 67-77, 1970. 3 tab, 11 ref.

Descriptors: *Industrial wastes, *Chemical wastes, *Toxicity, Marine animals, Marine plants, Food chains, Analytical techniques, Chemical analysis.

A method of analysis for estimating the toxicity of some chemical pollutants to flora and fauna is presented. The method measures the toxicity threshold for four links in the marine biological chain and shows the transmission of the toxin from phytoplankton to zooplankton to fish and finally to small mammifers. Results are given for several different industrial wastes. Kraft cellulose and metallic oxides were found to be the most toxic. (Ensign-PAI)

MICROBIOLOGICAL DETERMINATION OF METHYL-MERCURY,
Aarhus Univ. (Denmark). Inst. of Hygiene.
J. C. Hansen.
Vatten, Vol 4, p 365-368, 1970. 1 tab, 2 fig, 20 ref.

Descriptors: *Microbiology, *Oranic material, *Ecology, Food chains, Foods, Toxins, Toxicity, Pollutant identification, Water pollution effects.
Identifiers: *Microbiological technique, *Methyl mercury extraction, *Total mercury, *Demethylation.

Inorganic mercury in sediments has been found to methylate to methyl mercury and transfer to water soluble compounds thus allowing the mercury to accumulate in the food chains with the eventuality of harming human beings. A microbiological technique for determining the total content of mercury in organic material of foodstuffs, and the determination of the quantity of organic mercury appearing as methylated mercury is described. ISOLATION OF SALMONELLA FROM A POLLUTED MARINE ENVIRONMENT, TECHNIQUE AND ENRICHMENT MEDIA,
Aarhus Univ. (Denmark). Inst. of Hygiene.
K. Grunnet, A. Gundstrup, and G. J. Bonde.
Revue Internationale D'Oceanographie Medicale, Vol 17, p 165-177, 1970. 3 tab, 1 fig, 17 ref.

Descriptors: *Bioindicators, *Salmonella, *E. coli, *Coliforms, *Streptococcus.
Identifiers: *Technique, *Media, *Gulf of Aarhus.

Results of experiments over two years of the Salmonella frequency in the polluted Gulf of Aarhus are discussed. An approximate rectilinear relationship is found between the E. coli count and the frequency of Salmonella. Twenty five various serotypes were isolated. The number of isolates belonging in the S. typhimurium and S. paratyphi B groups with different concentrations of E. coli indicated a quicker die-away rate for S. typhimurium than for S. paratyphi B at E. coli counts lower than 300 per 100 ml. Investigations of bottom sediments, aquatic plants, mussels, and fish were also conducted. In very polluted areas salmonellas were detected in samples of all the categories mentioned except fish. TECTION OF OIL SLICK POLLUTION ON ATER SURFACES WITH MICROWAVE DIOMETER SYSTEMS,
crowave Sensor Systems, Inc., Downey, Calif.; d California Univ., Santa Barbara.
C. Aukland, W. H. Conway, and N. K. Sanders.
mote Sensing of Environment, International mposium, Sixth Proceedings. Ann Arbor, chigan, October 13-16, 1969, Vol II, p 789-796, 69. 5 fig, 5 ref.

scriptors: *Oil wastes, *Remote sensing, icrowaves, Pollutant identification, Oily water. ntifiers: Oil slick detection.

ere are two mechanisms by which oil slicks on a ter surface may be detected. An apparent tem-ature anomaly is created when oil is present and s local anomaly against the rather uniform sea nifies the detection of oil pollution. An analyti-basis for the mechanisms is developed and the ults of the experimental verification are sented. It is felt that the primary detection chanism for thin oil films is the change in sea te due to the presence of oil which sends strong nals to microwave radiometers when winds of 6 ots or more are blowing. The mechanism of ect change in the emissivity of the water surface e to the presence of oil is also considered. These detection methods are described separately. sign-PAI)

MONTHLY VARIATION IN PHOSPHATE AND RELATED CHEMICALS FOUND IN THE SEDIMENT IN THE ISLAND AREA OF LAKE ERIE, 1967-68, WITH REFERENCE TO SAMPLES COLLECTED IN 1964, 1965, AND 1966,
John Carroll Univ., Cleveland, Ohio; and Ohio State Univ., Columbus.
Edwin J. Skoch, and N. Wilson Britt.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 325-340, 1969. 16 p, 6 fig, 3 tab, 33 ref. OWRR Project A-008-OHIO (2).

Descriptors: *Sampling, *Bottom sediments, *Lake Erie, *Phosphates, Iron, Organic matter, Chemical analysis, Data collections, Water chemistry, Eutrophication, Nutrients, Path of pollutants, Great Lakes.

Samples of sediment collected in Lake Erie in 1964, 1965, 1966, and on a monthly basis from May, 1967 through November, 1968 were analyzed for total phosphate, iron and organic carbon. Samples were collected by means of an Ekman Dredge and by coring. The cores were sectioned at 2.5 cm intervals and each of the six sections was analyzed. Results of the analyses showed only a slight increase on phosphate since 1964. However all three factors showed a definite increase from May, 1967 through November, 1968. Monthly variation was quite distinct and more severe than the differences between years. The sediment was found to consist of two distinct layers, with the upper 5 cm of sediment usually higher in concentrations of materials than the lower portions. (See also W71-05561) (Knapp-USGS)

GAS CHROMATOGRAPHIC ANALYSIS OF MERCAPTANS, PHENOLS, AND ORGANIC ACIDS IN SURFACE WATERS WITH USE OF PENTAFLUOROBENZYL DERIVATIVES,
Federal Water Quality Administration, Cincinnati, Ohio. Analytical Quality Control Lab.
Fed K. Kawahara.
Environmental Science and Technology, Vol 5, No 3, p 235-239, March 1971. 5 p, 8 fig, 3 tab, 9 ref.

Descriptors: *Gas chromatography, *Organic acids, *Phenols, *Pollutant identification, Organic matter, Water analysis, Monitoring, Sampling, Chemical analysis.
Identifiers: *Mercaptans.

As organic interferences are present in surface water samples, qualitative and quantitative measurements of 0.1 microgram of phenols and (or) organic acids are extremely difficult to make when flame-ionization detection is used in gas-liquid chromatography. By converting the unidentified mercaptans, phenols, and organic acids to pentafluorobenzyl thioethers, ethers, and esters, respectively, subnanogram amounts of these compounds can be separated qualitatively and determined quantitatively by electron capture gas chromatography even with a 95% organic interference. The weak and strong acid fractions obtained from the chloroform extracts of the carbon adsorption samples collected at two field stations were analyzed. (Knapp-USGS)

THE DETERMINATION OF LOW LEVELS OF COBALT-60 IN ENVIRONMENTAL WATERS BY LIQUID SCINTILLATION COUNTING,
Geological Survey, Denver, Colo.

H. C. Claassen.
Analytica Chimica Acta, Vol 52, p 229-235, 1970. 7 p, 3 fig, 1 tab, 9 ref.

Descriptors: *Cobalt radioisotopes, *Radiochemical analysis, *Analytical techniques, *Methodology, Water chemistry, Hydrologic aspects, Ion exchange, Sediments, Soils, Soil water, Radioactive waste disposal.
Identifiers: *Cobalt-60, *Scintillation counting, Environmental waters.

Radioactive isotopes of cobalt may be present in waters, fluvial sediments, or soil samples as a result of nuclear detonations, radioactive waste disposal, or cobalt tracer studies. To evaluate movement of radiocobalt in hydrologic systems and to determine the cobalt-60 used in establishing equilibrium constants, distribution coefficients, reaction rates, and sorption equilibria, an outline is developed of methods used and an experimental procedure is described. Cobalt-60 is determined in waters at levels greater than 0.5 pCi per sample; a modification of the method may be used to analyze fluvial sediments and soils. After the cobalt has been separated, first as the hydroxide and then as the thiocyanate complex in methyl isobutyl ketone, it is counted in a liquid scintillation system at 80% efficiency. Separation factors achieved for six isotopes are generally greater than 2,000. The time for an analysis, exclusive of the counting and evaporation operations, is about 2 hr. (Lang-USGS)

MERCURY ADSORPTION OF CHROMIUM OXIDE GELS,
Brunel Univ., Uxbridge (England). Dept. of Chemistry.
F. S. Baker, and K. S. W. Sing.
Nature Physical Science, Vol 229, No 1, p 27, January 4, 1971. 1 p, 7 ref.

Descriptors: *Pollutant identification, *Adsorption, *Chromium, *Heavy metals, *Gels, Investigations, Methodology, Test procedures, Vapor pressure, Laboratory tests, Oxides.
Identifiers: *Mercury, *Mercury adsorption.

With certain chromium oxide gels, a significant amount of mercury vapor adsorption takes place at temperatures around 298 K. During prolonged outgassing of chromium oxide gels at 298 K, the weight of the sample decreased to a minimum (after 2-3 h) and then underwent a slow but uniform rate of increase. The weight change was arrested by the introduction of a small pressure of a permanent gas, but the same rate of increase was restored on further outgassing. When a similar experiment was performed using a microbalance (in place of the spring balance) and a mercury-free adsorption system, no increase in weight could be observed. It seemed likely that the weight increase was due to the adsorption of mercury vapor, which originated from various exposed mercury surfaces in the system (for instance the manometer). To test this hypothesis the mercury vapor pressure was increased three-fold by increasing the temperature of a mercury reservoir; immediately, the rate of increase in weight of the adsorbent was accelerated (initially two-fold). (Woodard-USGS)

Descriptors: *Pesticide residues, *Chemical analysis, *Gas chromatography, *Pesticide removal, *Methodology, Gels, Adsorption, Separation techniques, Pesticides, Aldrin, Dieldrin, Endrin, Heptachlor, Agricultural chemicals, Phosphothudate pesticides
Identifiers: *Pesticide removal (Alumina method), Silica gel method, Florisil method.

Rapid and economical removal of extraneous coextractives from pesticide residue extracts of water is made possible by the use of micro-cleanup columns. Three adsorbents--alumina, silica gel, and Florisil--as well as a variety of solvent systems were investigated. The recovery and cleanup of aldrin, chlordene, dieldrin, endrin, heptachlor, heptachlor epoxide, hexachlorobicycloheptadiene, hexachlorocyclopentadiene, isodrin, lindane, and methoxychlor were satisfactory, using any of the 3 adsorbents. The phosphorothioate pesticides malathion, methyl parathion, and parathion, however, could not be successfully recovered from Florisil when a modified Mills procedure was attempted. The micro-cleanup columns may also be used to perform a preliminary separation of a number of compounds that are difficult to resolve by gas-liquid chromatographic. (Woodard-USGS)

DIRECT DETERMINATION OF ELEMENTAL PHOSPHORUS BY GAS-LIQUID CHROMATOGRAPHY,
Fisheries Research Board of Canada, Halifax (Nova Scotia). Halifax Lab.
R. F. Addison, and R. G. Ackman.
Journal of Chromatography, Vol 47, p 421-426, March 1970. 4 fig, 2 tab, 10 ref.

Descriptors: *Phosphorus, *Gas chromatography, *Flame photometry, Water, Mud, Bioassay, Separation techniques, Chemical analysis.
Identifiers: Gas-liquid chromatography.

A recent problem of pollution of Newfoundland waters by yellow phosphorus led to the development of an alternative method of phosphorus analysis. The method employs gas-liquid chromatography, since (a) phosphorus is relatively low-boiling and volatile, and has been gas chromatographed, and (b) the development of various phosphorus-specific detectors allows the detection of as little as 10 to the -12th power g of this element. As in the classical approach phosphorus is partially isolated by extraction into a suitable organic solvent; a sample of this extract is then subjected to GLC, and the phosphorus response is compared to that of standards. Application of the method to the analysis of water, mud and biological samples is described. Advantages of the method are specificity, sensitivity, and rapidity of analysis over methods currently in use. (McCann-Battelle)
W71-05644

RELIABLE TESTS FOR PESTICIDES NOW AVAILABLE.

Science Journal, Vol 6, No 5, p 19-20, May 1970.

Descriptors: *Test procedures, *Dieldrin, *Fish, *Pesticides toxicity, Minnows, Thermal pollution, Bioassay.
Identifiers: *Tarpon.

A method for determining the toxicity of pesticides to fishes may eliminate inconsistencies in limits on their use. A study by Drs. C. E. Land and D. B. Seba at the University of Miami Rosenstiel School of Marine and Atmospheric Sciences showed that with most test procedures now used, much of the pesticide is rapidly lost from the test solution by vaporization or by fixation to containers. A test procedure for dieldrin has been developed in which these losses do not occur. In this method, the dieldrin is emulsified and the solution is circulated to the apparatus where the fish are exposed under controlled conditions. Exposure of tarpon by this method has shown that blood concentration of a pesticide is not a dependable indicator of its toxicity. Rather environmental conditions cause variations in sensitivity. The gill may be the primary route of pesticide intake in fish. (Little-Battelle)

CURRENT PROGRESS IN THE DETERMINATION OF THE POLYCHLORINATED BIPHENYLS,
California Univ., Berkeley. Inst. of Marine Resources.
R. W. Risebrough, P. Reiche, and H. S. Olcott.
Bulletin of Environmental Contamination and Toxicology, Vol 4, No 4, p 192-201, 1969. 18 ref. NSF Grant GB6362.

Descriptors: *DDT, *Gas chromatography, *Pollutant identification, Spectrometers, Fish, Birds, California.
Identifiers: *Polychlorinated biphenyls, Toxaphene, DDD, Nitration, Saponification, Chemical interference.

The general problem is reviewed of the pervasiveness of pesticide residues in fish and water fowl and conclude that in many cases, DDT and its derivatives have been erroneously identified in place of PCBs. They then describe the characteristics of gas chromatography and chemical methods which enable the analyst to differentiate PCBs from toxaphene, DDT, and DDD. (Little-Battelle)

MAYFLIES OF THE GENUS STENONEMA AS INDICATORS OF WATER QUALITY,
Federal Water Pollution Control Administration, Cincinnati, Ohio. Analytical Quality Control Lab.
Philip A. Lewis.
Available from: Analytical Quality Control Laboratory, 1014 Broadway, Cincinnati, Ohio 45202. For presentation at the 17th Annual Meeting of the Midwest Benthological Society, Kentucky Dam Village State Park, Gilbertsville, Kentucky, April 9-11, 1969. 13 p, 3 fig, 1 tab, 13 ref.

Descriptors: *Mayflies, *Bioindicators, *Organic wastes, *Ohio River, Dissolved oxygen, Analytical techniques, Water quality, Water pollution effects, Nutrients.
Identifiers: *Wabash River, *Little Miami River.

As a group, species of the genus Stenonema have not been widely used as pollution indicators because the taxonomy and ecology have not been well defined and the environmental requirements of individual species are yet to be determined. Several basket samples were collected during 1967 from the Ohio River, the Little Miami River, and the Wabash River and analyzed for Stenonema. Analysis of the samples and comparison of the results with those of other authors showed that the definition of the species is incomplete. A thorough description of the Stenonema obtained in the basket samples and their identifying features are included. Data are also given on the numbers of Stenonema collected at the various locations in the rivers. Stenonema integrum was abundant in samples affected by organic wastes. In the Little Miami River, S. pulchellum and S. interpunctatum are able to thrive in spite of organic enrichment because of aerated water. (Little-Battelle)

DETERMINATION OF SUBMICROGRAM QUANTITIES OF MERCURY IN LAKE WATERS,
Department of Energy, Mines and Resources, Burlington (Ontario). Canada Center for Inland Waters.
Yiu-Kee Chau, and Hirohumi Saitoh.
Environmental Science and Technology, Vol 4, No 10, p 839-841, October 1970. 2 fig, 1 tab, 12 ref.

Descriptors: *Spectroscopy, *Heavy metals, Pollutant identification, Separation techniques, Fresh water.
Identifiers: *Mercury, Dithizone extraction, Spectrophotometer, Sample preservation, Atomic absorption spectroscopy.

A simple and sensitive method for the determination of submicrogram amounts of mercury in lake water was developed by combination of concentration by dithizone extraction and gas-phase atomic absorption. The mercury was first extracted by dithizone, back extracted by hydrochloric acid, and then converted to vapor by a reduction-aeration reaction. A sensitivity of 0.008 micrograms per liter (0.008 p.p.b.) was achieved for water analysis. (Little-Battelle)
W71-05648

A SPECTROPOLARIMETRIC TITRIMETRIC METHOD FOR THE DETERMINATION OF CADMIUM, MERCURY, LEAD AND BISMUTH,
Texas A and M Univ., College Station. Dept. of Chemistry.
R. J. Palma, Sr., and K. H. Pearson.
Analytica Chimica Acta, Vol 49, p 497-504, March 1970. 3 fig, 3 tab, 11 ref.

Descriptors: *Volumetric analysis, *Ions, *Pollutant identification, Chelation, Hydrogen-ion concentration, Heavy metals.
Identifiers: *Cadmium, *Lead, *Bismuth, *Spectropolarimetric titrimetry, *Mercury, Polarimeter, Propylenediaminetetraacetric acid.

Spectropolarimetric methods of analyses of cadmium (II), lead (II) and bismuth (III) were developed, based on the stereospecific ligand, D- (-)-1,2-propylenediaminetetraacetic acid (D (-)PDTA). The optical rotation of the solution was monitored with a photoelectric polarimeter to determine the end-point of the titration. The effects of pH, wavelength, and dilution are discussed and the optimum conditions for the determination of each metal are established. The range of accurate analyses at 365 nm was 0.1 minus 0.001 m for cadmium (II), and 0.1 minus 0.0001 m for lead (II), mercury (II), and bismuth (III). The range of the average deviations from visual cholometry for the four metals titrated was 0.05 minus 0.29%. (Little-Battelle)
W71-05649

ANALYSIS OF FROZEN AQUEOUS SOLUTIONS BY SPARK SOURCE MASS SPECTROSCOPY,
Massachusetts Inst. of Tech., Lexington. Lincoln Lab.
E. B. Owens.
Analytical Letters, Vol 3, No 5, p 223-234, 1970. 2 fig, 1 tab, 9 ref.

Descriptors: *Spectroscopy, *Aqueous solutions, *Pollutant identification, *Heavy metals, Copper, Iron, Chromium, Potassium, Chlorine.
Identifiers: *Spark-source mass spectroscopy, Indium, Zinc, Nickel.

Aqueous solutions containing metals and other elements dissolved by acids were analyzed with a spark source mass spectrograph sparking to the frozen samples. The elements investigated were In, Zn, Cu, Ni, Fe, Cr, K, Cl. The minimum detection limit obtained from a 10 to the -8th power coulomb exposure is about 5 x 0.0000001 M solution concentration. Analytical precision of 8 to 30% relative is achieved through use of an internal standard. (Little-Battelle)
W71-05650

ENVIRONMENTAL MERCURY: RAPID DETERMINATION IN WATER AT NANOGRAM LEVELS,
Massachusetts Inst. of Tech., Cambridge. Dept. of Chemistry.
Robert W. April, and David N. Hume.
Science, Vol 170, No 3960, p 849-850, November 20, 1970. 2 fig, 2 ref.

Descriptors: *Spectrophotometry, *Pollutant identification, Heavy metals, Seawater, Massachusetts, Sewage.
Identifiers: *Mercury, *Plasma emission spectroscopy, Radiofrequency helium plasma, Charles River (Massachusetts).

Mercury compounds and free mercury are determined by emission spectrophotometry in a radiofrequency helium plasma. The method is simple, rapid, directly applicable to environmental water samples, and subject to few interferences. The useful working range is 10 nanograms to 10 micrograms, or 1 part per billion to 1 part per million in 10 milliliters of sample. The limit of detection is about 2 nanograms. (Little-Battelle)

A ROTATING SAMPLING ARM--AN AID TO AUTOMATIC ANALYSIS OR SAMPLING,
Upper Tame Main Drainage Authority, Birmingham (England).
J Phillips
Water Research, Vol 3, p 907-909, 1969. 2 fig, 1 ref

Descriptors: *Chemical oxygen demand, *Sampling, *Automation, *Mechanical equipment.

The sampling arm developed carried a glass sampling probe which on an initial signal drops into the sample for uptake of the required aliquot. The next signal causes the arm to life the probe out of the sample, rotate it to a set position above a receiving vessel and drop the probe into the vessel. After discharge of the sample that is taken the arm lifts and returns to its original position. The vertical movement of the arms is controlled by a solenoid attached to the pivoted arm which lifts when the solenoid is energized and drops as the solenoid is de-energized. Rotation of the arm is by means of a synchronous motor which will function in both forward and reverse directions. (Little-Battelle)

RECOVERY, SEPARATION, AND IDENTIFICATION OF PHENOLIC COMPOUNDS FROM POLLUTED WATERS,
Rutgers - The State Univ., New Brunswick, N. J. Dept. of Environmental Sciences.
Samuel D. Faust, Stutz Hansjakob, Osman M. Aly, and Peter W. Anderson.
Available from NTIS as PB-198 030, $3.00 in paper copy, $0.95 in microfiche. New Jersey Water Resources Research Institute, New Brunswick, Final Report, January 1971. 56 p, 8 tab, 5 fig, 16 ref. OWRR Project A-020-NJ (1).

Descriptors: *Phenol, *Industrial wastes, *Pollutant identification, Taste, Odor, Water pollution sources, *Chemical analysis, Rivers, Groundwater.

A four-year research program was completed wherein the rivers and groundwaters of New Jersey were sampled and tested for phenolic compounds. These chemicals originated in industrial manufacturing processes and are discharged into rivers and groundwaters through the waste waters. Over 500 samples in this four year program were collected from nearly all of the rivers in New Jersey. Several samples were drawn from the deep wells in the Camden, New Jersey, area. Approximately 71% of the samples contained these phenols in quantities that exceeded the potable water quality standard of 1 part per billion established by the New Jersey Environmental Protection Agency. Also, extensive chemical detective work led to the identification of several phenols in the Raritan River and Assunpink Creek. A chemical test was discovered for the detection and identification of phenols that originate in industrial waste waters. Phenols are a water pollutant in that they have the chemical property of imparting tastes and odor to drinking water. These tastes and odors are often described as being 'medicinal', 'chemical', 'aromatic', and 'iodine'. This new chemical test will help pollution abatement officials to trace this type of pollution to its source.

rs: *Kingston (Jamaica), Untreated

no master sewage scheme to dispose of wastes for Kingston's (Jamaica) popula- early half-a-million people. There is an al- al dependence on cesspits. Only the com- industrial and parts of the low income the city situated near the waterfront have any central disposal; this accounts for 5 million gallons of only primary treated sewage disposed into Kingston Harbor each day. In addition, numerous gulleys and drains also discharge organic wastes into the harbor. As a result, the entire northern shore has a bacterial coliform count which indicates that the water may be a potential health hazard for bathers, and other users of the sea-front. Furthermore, the high nutrient content of the water causes eutrophication and red tide blooms and large-scale fish-kills are occurring. The government has recently formed a special committee to conduct a monitoring program of Kingston Harbor in order to determine how far its pollution has advanced and to advise on what corrective measures should be taken in order to reverse the trend. (Woodard-USGS)

A QUANTITATIVE ANALYSIS OF THE EFFECTS OF BATHERS IN RECREATIONAL WATER QUALITY,
Tufts Univ., Medford, Mass. Dept. of Civil Engineering; and New York Sta Rochester.
N. B. Hanes, and A. J. Fossa.
Paper HA-9 presented at the 5th International Water Pollution Research Conference, July-August 1970, p HA-9/1-HA-9/9. 9 p, 9 tab, 14 ref. PHS Training Grant EH-69-647-C.

Descriptors: *Water quality, *Surface waters, *Recreation facilities, *Swimming, *Water supply, Testing, Test procedures, Water pollution, Analysis, Analytical techniques, Chemical analysis, Bacteria, Coliforms, Turbidity, Ammonia, Chlorides.

The effect of recreational uses of water quality was studied using a total of 64 subjects (38 male and 26 female) ages 6 to 38, and a plastic lined 3400-gallon swimming pool, 15 feet long by 10 feet wide and 3.5 feet deep. To reduce spillage, a water depth of 30 inches was used which provided an experimental capacity of 2700 gallons. The pool was filled weekly with water and allowed to stand until the chlorine residual dissipated. Except during periods of bathing, the pool water was filtered continuously through two Diatomaceous Earth spin filters with a combined capacity of 4500 gallons per hour. During an experiment, bathers swam for two consecutive fifteen minute periods. Samples were taken at two stations in the water (six to eight inches below the surface) and one station on the pool wall (also below the water surface). These samples were analyzed for total bacteria, Coliform, Enterococci, Pseudomonas aeruginosa, Turbidity, pH, Ammonia Nitrogen, and Chlorides. The results of this study are tabulated and clearly demonstrate that swimmers have a considerable influence on the bacterial and chemical quality of water. (Woodard-USGS)

LAKES: THE VALUE OF RECENT RESEARCH TO MEASURE EUTROPHICATION AND TO INDICATE POSSIBLE CAUSES,
Marine Dept., Rotorua (New Zealand). Fisheries Research Division.
G. R. Fish.
Journal of Hydrology (New Zealand), Vol 8, No 2, p 77-85, 1969. 1 fig, 2 tab, 18 ref.

Descriptors: *Lakes, *Eutrophication, Nutrients, Industrial wastes, Sewage effluents, Agriculture, Runoff, Nitrates, Phosphates, Ammonium salts, Thermal water, Flooding, Fertilization, Sampling, Flow rates, Rainfall, Evaporation, Springs, Biomass, Nitrogen fixation, Denitrification, Geysers.
Identifiers: Lake Rotorua (New Zealand).

Excessive plant growth in lakes and rivers is probably the most serious impediment to economic use of fresh waters throughout the world. The growth results from artificial enhancement of the fertility of the water, and this eutrophication is caused by large amounts of nutrient salts draining from highly developed catchments. Industrial and sewage effluents probably provide the most important sources of nutrient salts in the continents of America and Europe. Research begun in 1967 to study the physical, chemical, and biological features of Lake Rotorua (New Zealand) disclosed that the water and nutrient budget, calculated for the year June 1967-1968, disclosed that although sewage is an important source of eutrophication, run-off from agricultural land is probably a more important source of plant-fertilizing salts such as nitrate and phosphate. Certain thermal effluents (geysers) provide the major source of ammonium salts. Data collected during a flash flood on a small experimental catchment showed brief but greatly increased leaching of salts from the pastures. The conclusion that agricultural development is the most important cause of eutrophication of local lakes is supported by results published by workers in other parts of New Zealand. (Jones-Wisconsin)

WATER QUALITY AND WASTE WATER LOADINGS UPPER POTOMAC ESTUARY DURING 1969,
Environmental Protection Agency, Annapolis, Md. Chesapeake Technical Support Lab.
Norbert A. Jaworski.
Water quality status report. CTSL Technical Report No 27, MAR, Nov 1969. 62 p, 14 fig, 9 tab, 4 ref, append.

Descriptors: *Biochemical oxygen demand, *Phosphorus, *Nitrogen, *Coliforms, *Dissolved oxygen, Estuaries, Algae, Water pollution sources, Water pollution effects, Water quality.
Identifiers: *Potomac River estuary.

For the first eight months of 1969, about 55% of the BOD entering the Potomac Estuary from all major sources was from waste water discharges in the Washington area. Also these discharges contributed 86% of the total phosphorus and 66% of the total nitrogen. Total carbon entering the estuary from all sources was mainly in the form of inorganic carbon. Dissolved oxygen levels were measured. As a result of increased chlorination of the waste water treatment facility effluents, coliform

densities were significantly lower. To facilitate the determination of waste water discharge loadings, the estuary was zoned into fifteen mile reaches. Maximum waste discharge loadings for BOD (organic carbon), nitrogen and phosphorus have been determined for Zone I in the Washington area. Preliminary estimates of loadings have been established for Zone II downstream from the Washington area. (Aalto-Chesapeake Technical Support Laboratory)
W71-05409

POTOMAC-PISCATAWAY DYE RELEASES AND WASTE WATER ASSIMILATION STUDIES,
Environmental Protection Agency, Annapolis, Md. Chesapeake Technical Support Lab.
Norbert A. Jaworski, and James H. Johnson, Jr.
Special study conducted to evaluate effluent discharge effects in the Piscataway Creek tidal embayment. CTSL Technical Report No 19, MAR, FWQA, Dec 1969. 122 p, 54 fig, 27 tab, 8 ref, 3 append.

Descriptors: Water pollution effects, *Mathematical models, *Path of pollutants, Dye releases, Estuaries, Water pollution sources, *Waste assimulative capacity, Water quality.
Identifiers: *Piscataway Creek Embayment, *Potomac River estuary, Piscataway Waste water Treatment Plant.

Dye releases were made in the main channel of the Potomac Estuary and in the upper portion of the Piscataway embayment to simulate the movement of the effluents discharged from the Piscataway Waste Water Treatment Plant. Based on the data from the releases and the results from simulations by mathematical models of the upper Estuary and the Piscataway embayment it is concluded that the most advantageous waste water discharge location is on the main channel of the Potomac Estuary. (Aalto-Chesapeake Technical Support Laboratory)

AGRICULTURE AND THE PREVENTION OF RIVER POLLUTION, AS EXPERIENCED IN THE WEST OF SCOTLAND,
Clyde River Purification Board (Scotland).
F. J. Little.
Journal Proceedings of the Institute of Sewage Purification, 1966, p 452-454. 1 tab, 7 ref.

Descriptors: *Farm wastes, *Water pollution sources, Effluents, Cattle, Poultry, Hogs, Sheep, Rivers, Silage, Biological treatment, Waste water treatment.
Identifiers: *Scotland, Dairy cattle, Silage liquor, Sheep dips, Remedial action, Extended aeration, Rivers (Scotland) Act 1951.

Different types of polluting effluents in Scotland are discussed, and what action has been taken to prevent river pollution. Agricultural effluents can be divided into three groups - animal, vegetable, and chemical, of which animal effluents pose the greatest problem. Dairy waste is the most prevalent effluent, while beef, sheep, hogs and poultry play a minor role. Biological treatment here is in the experimental stage. Silage liquor has presented a problem due to its high BOD. Chemical effluents result from the use of sheep dips, herbicides, fertilizers, bactericides, and dairy detergents. Problems arise from careless use of equipment rather than intentional discharges. The problems of disposal are complex and require the patience and understanding of both farmer and the general public. A discussion follows the paper. (White-Iowa State)

DISEASE TRANSMISSION OF WATER-B ORGANISMS OF ANIMAL ORIGIN,
Minnesota Univ., St. Paul. Dept. of Vete Microbiology and Public Health.
Stanley L. Diesch.

Agricultural Practices and Water Quality, 1970, va State University Press, p 265-285. 93 ref.

scriptors: *Diseases, *Animal diseases, *Animal thology, *Human diseases, Farm wastes, thogenic bacteria, Pathogenic fungi, Pathology, ruses, Water transfer, Human pathology, rasitism, Water pollution sources.
ntifiers: Disease transmission, Rickettsia.

effort is made to indicate the potential demiologic significance based on the variability the resistant characteristics of various kinds of thogenic organisms and their potential for water nsmission. The historical implication of water l disease is briefly reviewed. The current oblems of disease transmission related to water is cussed. To document water's role as a vehicle in ease transmission, information gathered from a rature review was used. Specific disease entities grouped by classification based on etiology of causative organisms. Infectious diseases of mals and man caused by bacteria, Rickettsia, uses, fungi, and parasitic organisms are cussed. (See also W71-05437) (Christenbury-va State)

RPTION AND DESORPTION OF LORINATED HYDROCARBON PESTICIDES CLAY MINERALS,
ssouri Univ., Rolla. Dept. of Civil Engineering.
eng Sun Liao.
Sc Thesis, 1969. 147 p, 44 fig, 34 tab, 67 ref, 4 pend. OWRR Project A-016-MO (2).

scriptors: *Pesticides, *Adsorption, *Clay nerals, Path of pollutants, Pesticide kinetics, T, Dieldrin, Heptachlor, Illite, Kaolinite, Mont-rillonite, Equilibrium, Chlorinated hydrocarbon ticides, Sorption, Aqueous solutions, Soil mistry.
ntifiers: *Pesticide adsorption (Clays).

e sorption and desorption of chlorinated lrocarbon pesticides by clay minerals were stu-d under laboratory controlled environmental tems. Particular emphasis was directed toward investigation of the fundamental adsorption nomena which occurred in selected pesticide-y systems. The effects of certain environmental sses, including pH, temperature and salt (NaCl) concentration of water, on the behavior of sorption and desorption were also studied. Pesticides selected for this study included DDT, dieldrin and heptachlor, and clay minerals employed were kaolinite, montmorillonite and illite. Chlorinated hydrocarbon pesticides were rapidly adsorbed by the experimental clay minerals; in most cases the adsorption equilibria were reached within two hours of reaction. After the pesticides had been adsorbed on the clays, desorption of the pesticides occurred only to a very small extent. The pH, temperature and salt (NaCl) concentration of water did not appear to exert significant effects. (Knapp-USGS)

A THERMAL PROFILE OF THE WATERS OF NEW YORK STATE.
New York State Atomic and Space Development Authority, New York; and New York State Dept. of Environmental Conservation, Albany.

Report of the New York State Atomic and Space Development Authority, 1970. 26 p, 1 tab, 5 fig, 32 images.

Descriptors: *Thermal pollution, *Powerplants, *Environmental engineering, *Water temperature, *Cooling, Infrared radiation, Remote sensing, Water pollution sources.
Identifiers: *New York.

Existing temperature patterns of New York State's major bodies of water were determined. Base line data on the extent and location of natural and artificial heat sources are provided. Large natural variations in water temperature caused by geographic location and seasonal variations were recorded along with the 'fine structure' of temperature influenced by flow, depth, tidal effects and mixing. Diffusion and dissipation patterns of man-made thermal discharges in various bodies of water were investigated. The survey was conducted in ponds, marshes, rivers, lakes and coastal waters. Airborne infrared sensing devices and data collection and recording equipment were used and reduced by computer to produce the thermal profiles. Results of the survey will be used for site selection for future nuclear powerplants and for predicting dissipation and dispersion of future thermal discharges along with better designs of outfall and cooling facilities for full protection of the environment. DIFFUSION OF SEWAGE EFFLUENT FROM AN OCEAN OUTFALL,
Environmental Engineering, Inc., Gainesville, Fla.
R. H. Jones, and R. E. Stewart.
Revue Internationale D'Oceanographie Medicale, Vol 17, p 99-108, 1970. 1 tab, 2 fig, 3 ref.

Descriptors: *Water pollution sources, *Outlets, *Sewage effluents, *Diffusion, Coliforms, Bacteria, Florida.
Identifiers: *Pompano Beach.

Diffusion investigations were carried out to estimate coliform bacteria concentration patterns of sewage effluent from an ocean outfall at Pompano Beach, Florida. The physical oceanography of the near-shore currents, turbulent diffusion of the sewage effluent, and natural die-off of the coliform bacteria were studied. A current meter array, current-cross observations, and fluorescein dye were used to determine the near-shore current patterns. The sewage-dye plume, after Rhodamin dye was injected, was tracked by a fluorimeter. Coliform bacteria die-off rates were determined which indicated that during the summer months the natural die-off is approximately two orders of magnitude greater than that during the winter. A model to assess future outfall installations was developed. (Ensign-PAI)

SEASONAL VARIATIONS IN INORGANIC PHYTOPLANKTON NUTRIENTS IN THE INSHORE WATERS OF CARDIGAN BAY,
University Coll. of Wales, Aberystwyth. Dept. of Botany.
J. B. Sykes, and A. D. Boney.
Journal of the Marine Biological Association of the United Kingdom, Vol 50, No 3, p 819-827, 1970. 2 fig, 2 tab, 24 ref.

Descriptors: *Water pollution sources, *Seasonal, *Phytoplankton, *Nutrients, Phosphates, Nitrates, Silicates.
Identifiers: Cardigan Bay, Wales.

Concentrations of inorganic phosphate, nitrate and reactive silicate were studied in the inshore waters of Cardigan Bay during 1967-68. The observed variations were largely due to phytoplankton activity and meteorological conditions. During the winter months all nutrients were at their peak and all showed minimum concentrations during the summer. Inorganic phosphate seemed to decrease when nitrate and silicate concentrations were high. River drainage and freshwater run-off, introducing various pollutants in the study area had a definite effect on the nutrient balance. (Ensign-PAI)

INSTRUMENT TO MEASURE WEAK SEA CURRENTS,
Ente Nazionale per l'Energia Eletrrica. Cellole (Italy). Laboratorio Ricerche Ambientali Garigliano.
G. Bartoli, G. Sandrelli, and G. Sorrentino.
Revue Internationale D'Oceanographie Medicale, Vol 17, p 109-123, 1970. 3 fig, 4 ref.

Descriptors: *Currents, *Current meters, *Pollution abatement, *Diffusion, Instrumentation, Water pollution sources.
Identifiers: *Sea currents.

It is necessary in diffusion problems to measure sea currents of speeds less than the threshold of sensitivity of current meters normally used. A new instrument is described, where by abandoning all the mechanical systems which always have friction and exploit the cooling down of a hot thermistor which is suitably compensated for by the temperature variations of the water, a threshold of 0,3 cm/sec. can be reached. Direction measurement is obtained by a magnetic needle with optical finders and a rotating element with a double direction of rotation which registers position with a circular potentiometer. Measurement of a minimal movement in the direction of 3 degrees is possible. The maximum duration of the instrument is 5 days and can be used to a depth of 30 meters. (Ensign-PAI)
W71-05522

ON THE UNUSUAL PATTERNS OF PHOSPHATE VERTICAL DISTRIBUTION IN THE TAMAR ESTUARY,
Brussels Univ. (Belgium). Laboratoire de Botanique Systematique et d'Ecologie.

J. P. Mommaerts.
Journal of the Marine Biological Association of United Kingdom, Vol 50, No 3, p 849-855, 1970. 4 fig, 1 tab, 5 ref.

Descriptors: *Water pollution sources, *Phosphates, *Distribution patterns, *Estuaries.
Identifiers: Vertical distribution, *Tamar Estuary, Great Britain.

Anomalies in the vertical profile of phosphate concentration were revealed in a chemical investigation of the Tamar Estuary. These variations were not matched by that of salinity. Correlations between nitrogen and salinity and silicate and salinity were excellent. Biological activity and pollution as possible causes of this phenomenon are discussed. (Ensign-PAI)
W71-05525

THE FATE OF INTESTINAL BACTERIA IN THE SEA,
Harvard Univ., Cambridge. Div. of Engineering and Applied Physics.
Ralph Mitchell, and Morris J. Carrell.
Advances in Water Pollution Research, International Conference on Water Pollution Research, Fourth, Proceedings, Prague, Czechoslovakia, April 21-25, 1969, Pergamon Press, New York, p 811-821, 1969. 2 fig, 2 tab, 8 ref.

Descriptors: *Sewage, Sea water, *Self-purification, *Microorganisms, *Marine microorganisms, *Sewage bacteria, Water pollution sources, Waste disposal.
Identifiers: E. coli, Bdellovibrio, Pseudomonas, Nematodes.

Native marine microflora is active in the death of intestinal bacteria in the sea and the death rate increases with increase of the marine microbial population. Several groups of bacteria have been found to be associated with E. coli kill in sea water. Pseudomonas, causes death by enzymatically lysing the cell walls of the intestinal bacteria. Bdellovibrio, is parasitic and acts by actively parasitizing the coliforms and using the whole cell as a carbon source. Nematodes have also been found to prey on intestinal bacteria. It is likely that the significance of each group will vary temporarally and geographically depending on the ecoloigcal circumstances. There is reason to believe that the ecological principles that apply to the sea would also apply to other environments. (Ensign-PAI)

NUMERICAL SIMULATION OF WATER QUALITY IN COASTAL WATERS AND ESTUARIES,
Rand Corp., Santa Monica, Calif.
J. J. Leendertse.
1970 IEEE International Conference on Engineering in the Ocean Environment, Panama City, Florida, September 21-24, 1970, Digest of Technical Papers, p 253-255. 2 ref.

Descriptors: *Estuaries, *Coasts, *Water quality, *Management, *Waste disposal, Dispersion, Tides, Flow, Model studies.
Identifiers: *Numerical simulation, *Fluid wastes.

Water quality management in coastal waters and estuaries must assess the effects of fluid wastes entering these waters. A model which computes the tidal flow and time-varying water levels in well mixed estuaries and coastal waters where salinity distributions at any point are uniform over the vertical was developed. The various composition of the fluid wastes can react with each other or with substances in the water so a reaction model was included. These reaction rates are influenced by water temperature and solar radiation. Wind and waves effect the exchange of gases at the water surface. Adjustment of the model using field measurements was necessary to establish the functional relationships. (Ensign-PAI)

THE USE OF RADIOISOTOPE TRACERS IN THE STUDY OF THE DISPERSION AND INACTIVATION OF BACTERIA DISCHARGED IN COASTAL WATERS,
Israel Atomic Energy Commission, Yavne. Soreq Nuclear Research Centre; Hadassah Medical School, Jerusalem (Israel); and Tel-Aviv District Public Health Lab. (Israel).
Chaim Gilat, H. I. Shuval, Y. Yoshpe-Purer, and Naftali Cohen.
Developments in Water Quality Research. Jerusalem International Conference on Water Quality and Pollution Research, Proceedings, Jerusalem Israel, June 1969, Tel Aviv, Ann Arbor Humphrey Science Publ, p 269-288, 1970. 8 fig, 9 ref.

Descriptors: *Radioisotopes, *Tracers, *Waste water disposal, *Bacteria, *Microorganisms, Water pollution sources.
Identifiers: Microbial dispersion, Microbial activation, Coastal waters.

The ever-increasing waste water disposal into coastal waters calls for the development of a realistic approach to define the influence of environmental factors which aid in dispersing and inactivating microbial pollutants. Data on rates of bacterial die-away in the Mediterranean is scant and very little data has been gathered on bacterial dispersion patterns on the shores of Israel. This investigation is an attempt at determining bacterial disappearance rates and dispersion patterns in situ by radioisotope tracer methods. Sewage outfall at Reading, north of Tel Aviv, was the site of these studies as it is representative of coastal conditions along Israel's southern Mediterranean shore. (Ensign-PAI)

RHINE RIVER POLLUTION STUDIES,
Cornelius Biemond.
Journal American Water Works Association, V 63, No 1, p 36-40, January 1971. 5 p, 3 fig, 3 tab ref.

Descriptors: *Water pollution sources, *Water p lution control, *Surveys, *Rivers, Industrial wast Mine wastes, Sewage, Oily water, Dissolved o ygen, Nutrients.
Identifiers: *Rhine River.

As for all rivers of highly developed areas, the p lution of the Rhine has become a serious proble The countries concerned (Switzerland, Franc Western Germany, Luxemburg and The Neth lands) have agreed to the initiation and continu tion of the International Commission for the Pr tection of the Rhine against Pollution. The powe of the commission are limited to collaboration research and investigations and to the unanimo

rmulation of proposals to the governments. For
pollution problems, the periods of low flow are
critical ones. They usually occur around the
nth of October, when snowmelt in Switzerland
s ceased and autumn rains in the remainder of
basin are delayed. Most of the sewage from
vns and industries is discharged untreated or
y mechanically treated. Apart from domestic
l industrial sewage, there is a continuous
charge of mineral matter by mines and indus-
es, which has led to an increasing load of dis-
ved minerals. (Knapp-USGS)

A thorough review of the mechanisms of nutrient deposition and exchange in aquatic environments led to the following conclusions: (1) A portion of the nutrients, soluble and insoluble, in a water body are ultimately destined to become part of the sediments. (2) Organisms are primary concentrators of dissolved nutrients. (3) The initial areas of deposition may be only temporary, the nutrient-containing sediments may be re-dissolved or may be physically transported. (4) Wind-induced currents are a major factor that determines the rate and area of final deposition and the contact time between suspended sediments and water. (5) Morphology of the water body affects the ultimate area of deposition. (6) Aquatic organisms convert inorganic nutrients to organic nutrients and vice versa. (7) Suspension of sediments increases their effect on the overlying water. (8) The sediments act as reservoirs of nutrients for the overlying water. (9) The rapidity of sediment build-up will affect the degree of influence on the overlying water. (Little-Battelle)

RESIDUES IN FISH, WILDLIFE AND ESTUARIES,
Bureau of Commercial Fisheries, Gulf Breeze, Fla. Center for Estuarine and Menhaden Research.
David J. Hansen, and Alfred J. Wilson, Jr.
Pesticides Monitoring Journal, Vol 4, No 2, p 51-56, September 1970. 1 fig, 2 tab, 6 ref.

Descriptors: *DDT, *Perches, *Water pollution effects, Dieldrin, Endrin, Florida, Estuaries, Oysters, Gas chromatography, Migration, Wildlife.
Identifiers: *Pinfish, Sample preservation, Pigfish, Atlantic croaker, Spot, Thin-layer chromatography, Metabolites, DDD, DDE.

Pesticide residues in fishes from the estuary near Pensacola, Fla., monitored from April 1964 to November 1965, are compared with residues in fishes exposed to DDT in the laboratory. DDT in fish exposed to 0.1 ppb p,p'-DDT for 5 weeks failed to increase after the second week, when maximum concentrations reached 38,000 times that in the test water. Loss of DDT from these fish was slow, 78%-87% in 8 weeks. The amounts of DDD or DDE in fish did not increase either during or after exposure. (Little-Battelle)

THE COURSE OF BIODEGRADATION OF ANIONIC DETERGENTS BY ANALYSES FOR CARBON, METHYLENE BLUE ACTIVE SUBSTANCE AND SULFATE ION,
Department of Agriculture, Philadelphia, Pa. Eastern Utilization Research and Development Div.
T. C. Cardon, E. W. Maurer, and A. J. Stirton.
Journal of the American Oil Chemists' Society, Vol 47, No 6, p 203-206, June 1970. 7 fig, 1 tab, 7 ref.

Descriptors: *Alcohol, *Sodium sulfates, Biodegradation, Carbon, Detergents, Turbidity, Microorganisms, *Linear alkylate sulfonates.
Identifiers: *Methylene blue active substance, *Sulfate ion, Glucose, Esso research test, Auto analyzer.

The results are presented of an investigation of the metabolism of tallow-based detergents and a mechanism of their breakdown by sewage microorganisms under aerobic conditions. The detergents were tallow alcohol sulfates, ether alcohol sulfates, and esters of a-sulfo fatty acids. Other compounds were included to help relate structure to ease of biodegradation. The individual isomer sodium p-(1-methylundecyl) benzenesulfonate (LAS) was used as a reference standard. Since biodegradation was followed by loss of carbon and methylene blue active substance (MBAS) and formation of sulfate ions, the Esso research test was employed as a basis for a method for the measurement of these subfactors. Tallow alcohol sulfates were rapidly and completely degraded; ether alcohol sulfates not quite so rapidly. Reduction in MBAS was rapid for the a-sulfo esters, but loss of carbon and formation of sulfate ion were incomplete, possibly because of the intermediate formation of a resistent sulfosuccinate. Figures show the rates of biodegradation of various alcohol sulfates and fatty acids as determined by carbon loss, MBAS reduction, and formation of sulfate ions. (McCann-Battelle)

GROUNDWATER POLLUTION,
Michigan Dept. of Public Health, Lansing Section of Water Supply.
Donald K. Keech.
Typescript, 1970. 20 p.

Descriptors: *Water pollution, *Groundwater, *Path of pollutants, *Pollutant identification, *Michigan toxins, Soil contamination, Wastes, Water pollution control, Water pollution effects, Water pollution sources, Natural gas, Gasoline, Calcium chloride, Aquatic bacteria, Waste disposal, Detergents, Michigan.
Identifiers: *Chemical contamination, Salt, Brine, Natural gas erruptions.

The purpose of this paper is to show, mainly by example, how the valuable groundwater resource has been contaminated, primarily through negligent practices. Pollution of groundwater results in degradation of the water quality in one of three categories: Micro-biological, chemical, and physical. Case histories of various contaminations within the State of Michigan are explored. The report is well documented and well illustrated. It stresses concern over possible problems than can cause irreversible damage to the valuable groundwater resource. (Campbell-NWWA)

RURAL RUNOFF AS A FACTOR IN STREAM POLLUTION,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio. Cincinnati Water Research Lab.
R. B. Weidner, A. G. Christianson, S. R. Weibel, and G. G. Robeck.
Journal Water Pollution Control Federation, Vol 41, No 3, p 377-384, March 1969. 10 tab, 6 fig, 3 ref.

Descriptors: *Surface runoff, *Water pollution, Farm wastes, Storm runoff, Water quality, Acreage, Cultivated lands, Grasslands, Pastures, Forests, Urbanization, Land use, Nitrogen, Phosphorus, Soil erosion, Watersheds, Physical characteristics, Slopes, Fertilizers, Pesticides, Mulching, Flow measurement, Sampling, Flumes, Coliforms, Precipitation, Rainfall intensity, Time, Corn, Regression analysis, Biochemical oxygen demand, Chemical oxygen demand.
Identifiers: Soil characteristics, Measuring flume.

The results of this work indicate that rural runoff is a factor in stream pollution and that it must be considered when one evaluates the quality of any stream or receiving body of water. However, there also must be an awareness that there are some means available for reducing this pollutional load. This study showed that, despite an increase in the amount of fertilizers and manure applied under improved practices, there was a marked decrease in the amount of pollutional load that came from these watersheds as contrasted to the load from watersheds using prevailing practices. Runoff, soil loss, and microbial densities were considered. (White-Iowa State)

ORIGINS AND NATURE OF FARM WASTES,
National Agricultural Advisory Service, London (England).
K. B. C. Jones, and C. T. Riley.

Proceedings of Symposium: Farm Wastes: The Institute of Water Pollution Control and The University of Newcastle upon Tyne, Paper No 1, p 7-14, 1970. 9 tab.

Descriptors: *Farm wastes, *Disposal, Rain water, Costs, Cattle, Hogs, Poultry, Planning, Legislation, Legal aspects, Economics, *Waste disposal.
Identifiers: *United Kingdom, Washing-down water, Nature of waste, Population equivalents, Origins of waste.

Waste disposal is discussed in relation to population expansion, diminishing acres, declining numbers of agriculture workers, economic pressures, limited natural water resources, and legal pressures. The origin and nature of the wastes that must be disposed of is discussed. The trends in planning and disposal patterns taking place were considered. The costs associated with disposal were examined in relation to the income produced. Food processing waste has created some disposal problems for farmers. The disposal problems created by fruit and meat processing are discussed in the last portion of the paper. (See also W71-05747). (Christenbury-Iowa State)

ORIGINS AND NATURE OF FARM WASTES: DISCUSSION,
Gowan, Douglas.
Douglas Gowan.
Proceedings of Symposium: Farm Wastes: The Institute of Water Pollution Control and The University of Newcastle upon Tyne, Paper No 2, p 15-18, 1970. 1 tab.

Descriptors: Farm wastes, Disposal, Legislation, Discharge (Water), Sewers.
Identifiers: River authorities, Extensive farmer, Intensive farmer, United Kingdom, Public sewers.

Disposal of farm waste has become a major problem. A wholehearted effort is needed to deal with the problem, involving men, laboratories, and money. Also the farmers themselves must lend practical assistance. The law is there, and social and economic pressures are unlikely to ease. Nor is farming going to become less intensive, when this is the only way to profit, and the increasing public demand for food exists. All must combine to make sure that our inherent desire for increased water resources and pleasant-looking and smelling countryside facilities are one day realized. (See also W71-05747). Descriptors: *Water quality, Self-purification, *Pollution abatement, Environment, Ecology, Water pollution control, Water pollution sources.
Identifiers: Environmental problems, Macroinvertebrates.

The Kalamazoo River was studied to ascertain conditions just prior to a pollution-abatement program. The river was found grossly polluted in a twenty-mile stretch below the City of Kalamazoo. The decomposition of organic matter in the water and in extensive silt accumulations frequently depleted the dissolved oxygen for twenty miles or more below Kalamazoo. Sewage fungus covered the surface of the sludge deposits and stationary objects in the water, while extensive numbers of sludge worms frequently occurred as an enormous red fringe along the river margins. Only a few of the more tolerant macroinvertebrates and fish occurred in the very polluted zone. In the lower reaches of the river, considerable self-purification was accomplished, accompanied by a return of many of the Macroinvertebrates and game fish. Prior to its discharge, the river accomplished considerable self-purification but still carried a large load of suspended and dissolved materials into Lake Michigan. (Wray-Chicago)

BACKGROUND PAPERS ON COASTAL WASTES MANAGEMENT.
National Academy of Sciences-National Research Council, Washington, D.C. Committee of Oceanography; and National Academy of Engineering, Washington, D.C. Committee on Ocean Engineering.

Prepared for Coastal Wastes Management Study Session held at Jackson Hole, Wyo. 6-12 July 1969. Available from NTIS as PB-198 032, $6.00 paper copy, $0.95 in microfiche. Washington, DC, Vol I, 1969. 391 p. FWQA Program 16060 DUF 07/69.

Descriptors: Water pollution sources, *Water pollution control, Wastes, *Pollutant identification, *Coasts, Water pollution effects, Estuaries.
Identifiers: Coastal wastes.

This collection of background papers in coastal wastes management is a supplement to the NAS-NAE report, 'Wastes Management Concepts for the Coastal Zone Requirements for Research and Investigation.' (See W71-01544). The report itself was prepared under the auspices of the Committee on Oceanography of the National Academy of Sciences (NASCO) and the Committee on Ocean Engineering of the National Academy of Engineering (NAECOE). The study session was convened for the purpose of reviewing the state-of-the-art and knowledge concerning the disposal of wastes in the coastal environment, and identifying the areas in which expansion of scientific and engineering knowledge is required for rational evaluation of waste management problems in the coastal zone. EVALUATION OF SOURCES AND CHARACTERISTICS OF WASTE DISCHARGES,
Los Angeles Bureau of Sanitation, Calif.
Robert D. Borgman, and John D. Parkhurst.
Background Papers on Coastal Wastes Management, prepared for National Academy of Sciences Committee on Oceanography and the National Academy of Engineering Committee on Ocean Engineering, Wash, DC, Vol 1, 1969, p II-117.

Descriptors: *Wastes, *Water pollution sources, *Human population, *Ecology, *Pollutants, Farm wastes, Mine wastes, Municipal wastes, Solid wastes, Radioactive wastes, Chemical wastes.

Waste discharges as they affect the littoral region of U.S. coasts are evaluated. Agricultural and mining wastes make up 2.3 billion tons per year. Air pollution discharges, liquid and solid municipal wastes and automobile bodies contribute 507 million tons per year to these areas. The composition, decomposition and treatment of known wastes along with the standard methods of sampling, monitoring and analysis are discussed. The speculative unknown waste discharges are discussed and the need for systematic summation and integration of the known wastes are considered. (See also W71-05787) (Ensign-PAI)

ground Papers on Coastal Wastes Manage-
, prepared for National Academy of Sciences
Committee on Oceanography and the National Academy of Engineering Committee on Ocean Engineering, Wash, DC, Vol 1, 1969, p X 1-X 44. 1 fig, 8 tab, 20 ref.

Descriptors: *Wastes, *Water pollution sources, *Chemical analysis, *Geochemistry, *Trace elements, Absorption, Precipitation, Oxidation-reduction potential, Organic compounds, Carbon, Metals, Organic matter, Radioisotopes, Surfactants.

Concentrations of minor constituents in the ocean, and the forms they take: metallic elements, nitrogen, phosphorus, silica, and living and non-living organic matter are reviewed. The physical-chemical processes regulating the composition of the oceans such as reactivity and mass balance of elements added to the sea, adsorption-desorption reactions of trace metals, precipitation-dissolution reactions, oxidation and reduction processes and biological concentrations are described. Organic carbon in the oceans, cycling between sea-land and sea-atmosphere, and the metal organic complexes in sea water are also discussed. The changes caused by man's activities and the effect of changed rates of element additions to the oceans along with additions of unnatural substances by rivers, industrial and domestic wastes, outfalls, shipping, mining, and fallout are considered. (See also W71-05787) (Ensign-PAI)

SOME CHEMICAL AND GEOCHEMICAL PROCESSES WHICH INTERACT WITH AND INFLUENCE THE DISTRIBUTION OF WASTES INTRODUCED INTO THE MARINE ENVIRONMENT,
Washington Univ., Seattle. Dept. of Oceanography.
Francis A. Richards.
Background Papers on Coastal Wastes Management, prepared for National Academy of Sciences Committee on Oceanography and the National Academy of Engineering Committee on Ocean Engineering, Wash, DC, Vol 1, 1969, p XI 1-XI 25. 2 tab, 27 ref.

Descriptors: *Wastes, *Environment, *Chemical analysis, *Geochemistry, *Distribution, Oxidation-reduction potential, Precipitation, Chemical reactions, Flocculation, Aggregates, Sorption.
Identifiers: Complexation.

The inorganic chemical and geochemical reactions that take place when foreign materials are introduced into the ocean are discussed with emphasis on the non-life processes. The kinds of processes that can take place, a review of present knowledge of these processes and suggestions for future research on how these processes are concerned in coastal waters management are presented. Included in these processes are changes in phase, oxidation state, ionic or molecular speciation, and chemical activity caused by any process which changes temperature, pressure, ionic strength, or composition. Specifically, processes of acid-base reactions, redox reactions, complexation, ion exchange reactions, sorption, precipitation, flocculation and aggregation are covered. It is pointed out that toxic and non-toxic wastes should have quite different chemical and geochemical consequences. (See also W71-05787) (Ensign-PAI)

BIOLOGICAL PROCESSES WHICH INTERACT WITH AND INFLUENCE THE DISTRIBUTION OF WASTES INTRODUCED INTO THE MARINE ENVIRONMENT,
Johns Hopkins Univ., Baltimore, Md. Dept. of Geography and Environmental Engineering.
Loren D. Jensen.
Background Papers on Coastal Wastes Management, prepared for National Academy of Sciences Committee on Oceanography and the National Academy of Engineering Committee on Ocean Engineering, Wash, DC, Vol 1, 1969, p XIV 1-XIV 9. 6 ref.

Descriptors: *Wastes, *Environment, *Distribution, *Biology, Organic compounds, Inorganic compounds, Bacteria, Biodegradation.

Living organisms inhabiting surface waters are adapted to dilute solutions of inorganic salts, atmospheric gases and extracted organic materials. Due to the volumes involved and the dilute nature of the waste streams and coastal waters the physical, chemical and biological processes that occur when such solutions mix are considered. The main biological processes which are involved with waste stabilization are bacterial fermentation which occur on wetted surfaces. The exploitation of these processes is the primary mechanism of waste stabilization with conventional biological waste treatment systems. These biological processes which interact with and influence the distribution of wastes are discussed in detail. See also W71-05787) (Ensign-PAI)

THE COASTAL POLLUTION PROBLEM IN CALIFORNIA,
Scripps Institution of Oceanography, La Jolla, Calif.
John A. McGowan.
Background Papers on Coastal Wastes Management, prepared for National Academy of Sciences Committee on Oceanography and the National Academy of Engineering Committee on Ocean Engineering, Wash, DC, Vol 1, 1969, p XV 1-XV 3.

Descriptors: *Waste disposal, *Oceans, *Water pollution control.
Identifiers: *California, Tolerable waste limits, Pollution study grants, Regional planning, Basic research, Sampling, Monitoring.

A three month study of the literature on coastal waste disposal in California indicates that the magnitude of coastal pollution has not yet reached that of the state's fresh waters and estuaries but they are definitely in the incipient stages of such magnitude. The many sewage outfalls are greatly influencing the ecology of the coastal zone. Particulate organic detritus deposits in the area of outfalls seem to be increasing and it is doubtful an equilibrium will be reached. More of these outfalls are being planned and since coastal waters do not mix perfectly the outlook for coastal ecology is not good. Proposals for tolerable limits; pollution studies grant proposals; development of ecological, biochemical and physiological indices; and regional planning for research laboratories and waste disposal systems are set forth. PHOSPHATE DISTRIBUTION IN FOX AND WOLF RIVERS, WISCONSIN,
Aamund Salveson.
Water and Sewage Works, p 142-152, May 1970. 4 fig, 15 ref.

Descriptors: *Phosphates, *Water pollution sources, *Sampling, Rivers, Fish kills, Biodegradation, Fertilizers, Municipal wastes, Wisconsin.
Identifiers: *Fox River (Wis), *Wolf River (Wis), Poly-phosphates, Ortho-phosphates.

Analyses of the surface water samples of the two rivers included determinations of soluble orthophosphate, total and polyphosphates, pH value, filterable residue, and temperature. The Wolf River showed relatively low contents of total and orthophosphates, except in the Markton, New London, and Freemont sections, influenced by discharge of sewage or by fertilizer-enriched runoff. In spite of the abundance of algae and fish kills, filtered water of Lake Poygan was very low in phosphates suggesting their intensive fixation by phytoplankton. The Upper Fox River showed an extremely high concentration of phosphates (1.30 to 1.50 mg/l of phosphorus tetraoxide) near Fort Winnebago and the sewage outlet of the town Portage. The section from Montello to Omro preserved a rather high concentration of the total phosphates, but contained very small amount of orthophosphates (below 0.10 mg/l). The Fox River from Neenah to Green Bay exhibited only small variation in moderately high contents of both forms of phosphorus. (Wilde-Wisconsin)

EFFECTS OF DOMESTIC SEWAGE ON AQUATIC INSECTS AND SALMONIDS OF THE EAST GALLATIN RIVER, MONTANA,
Montana Cooperative Fishery Unit, Bozeman.
E. L. Avery.
Water Research, Vol 4, p 165-177, 1970. 2 fig, 7 tab, 17 ref.

Descriptors: *Rivers, *Water pollution effects, *Municipal wastes, Trout, Aquatic insects, Salmonids, Diptera, Montana.
Identifiers: *East Gallatin River (Mont), Sphacrotilus, Trichoptera, Ephemeroptera, Coleoptera, Plecoptera.

Sampling of aquatic insects and salmonids at the Bozeman municipal sewage outfall disclosed a depressing effect on the density of Trichoptera, Ephemeroptera, Coleoptera, and Plecoptera larvae. This effect was related to the occurrence of 'sewage fungus,' Sphaerotilus sp. A partial recovery of the insect community was observed at 3.85 miles below the outfall. At about 12.5 miles below the discharge, the fertilizing influence of diluted sewage raised the number of aquatic insects about 13 times above the normal. Rainbow, brown, and brook trout and mountain whitefish were found above the outfall, but only rainbow trout were present below the discharge beginning with the point where complete mixing of the sewage had occurred. The winter increase in ammonia nitrogen below the discharge reduced the standing crop of the trout. (Wilde-Wisconsin)

SOME EFFECTS OF TEMPERATURE ON SURVIVAL AND METABOLISM OF SELECTED ESTUARINE BIVALVES,
Rhode Island Univ., Kingston. Dept. of Zoology.
Victor S. Kennedy.
PhD thesis, 1970. 153 p, 26 fig, 22 tab, 48 ref, Append A, B, C, D, E. OWRR Projects A-002-MD (6) and A-011-MD (1).

Descriptors: *Metabolism, *Estuaries, *Clams, Water pollution effects, Maryland, Temperature, Respiration, Size, Weight, Acclimatization, Thermal water, Distribution, Latitudinal studies, Geographical regions, Benthos, Spawning, Salinity, Age, Computer programs.
Identifiers: *Bivalves, Compensatory adaptation, Patuxent Estuary (Md), Mya arenaria, Macoma balthica, Macoma phenax, Mulinia lateralis, Gemma gemma.

Significance of thermal discharge into the environment led to a study of Mya arenaria, Macoma balthica, Mulinia lateralis, Gemma gemma, and Macoma phenax, determining upper lethal temperatures. Sensitivity to slight temperature differences, probably reflected real physiological differences. Young Mya arenaria and Macoma balthica were more high-temperature tolerant than older clams of same species. Their vertical benthic distribution may be significant with relation to age and species differences. When Mya are killed by high temperatures, the more resistant Gemma may occupy the space. Resettlement of Mya would be prevented by larval Mya-adult Gemma competition. Spawning patterns of Mya and Macoma balthica in summer in Chesapeake Bay benthos could be affected by thermal discharge eliminating Mya and influencing interactions of Mya-Gemma. Respiration rate of Macoma balthica, Mulinia lateralis and Mya arenaria decreased with increasing size, and varied directly with temperature. Cold-acclimated Mulinia and Mya were metabolically depressed by high temperatures (30C), and low temperatures (1-2C) depressed or disrupted their metabolism while they were warm-acclimated. Even minor thermal loading of the benthos would elevate metabolism adversely. (Jones-Wisconsin)

Bacteriological water quality status report for January to March 1967. CTSL Technical Report No 6, MAR, March 1969. 39 p, 7 fig, 13 tab, 6 ref.

Descriptors: *Bacteria, *Coliforms, *E. Coli, *Salmonella, Indicators, Estuaries, Water pollution effects, Water pollution sources, Water quality.
Identifiers: *Potomac River estuary, Coliform indicator relationships.

Data on the bacteriological water quality of the upper Potomac Estuary are presented. Coliforms and fecal coliforms are considered to be useful as indicators of bacterial pollution. Major sources of coliform organisms in the upper estuary are waste water discharges, storm and combined sewers a freshwater inflows. The contribution of colifo organisms from waste water effluents is found to hundredfold greater than from the freshwater flow from the upper basin. No estimate was ma of storm or combined sewer contributions. (Aal Chesapeake Technical Support Laboratory)

Descriptors: Water pollution effects, *Manganese, *Fallout, *Benthos, Radioactivity effects, Water pollution sources.
Identifiers: *Concentrations, *Occurrence, Distribution, Mediterranean Sea.

Marine benthos of the Mediterranean were investigated for accumulation of 54Mn. The manganese content of certain species of marine organisms and the distribution in the various organs and tissues were observed. The ascidian Halocynthia papillosa, the lamellibranch mollusc, Pinna nobilis, and the annelid worm, Hermione hystrix all showed high 54Mn content. Detectable amounts of 54Mn were found in the ash of the tube worm, Spirographis spallanzani. In Pinna the highest concentration of 54Mn was in the hepatopancreas. In polychaete worms concentrations were found in the external body structures. Although high radioactivity from fallout 54Mn was usually related to high manganese content in the organism, the specific activity of 54Mn varied. Among fallout radionuclides, 147 Pm seemed to be present in those organisms that concentrate 54Mn. (Ensign-PAI)

BACTERIOLOGICAL STUDIES IN THE BAY OF NAPLES,
Indiana Univ., Indianapolis. Dept. of Microbiology.
T. D. Brock.
Revue Internationale D'Oceanographie Medicale, Vol 17, p 159-163, 1970. 1 tab, 3 ref.

Descriptors: Pollutants, *Bacteria, *Mollusks, *Marine plants, Ecology, Water pollution effects.
Identifiers: Epiphyte, Spirochete, *Bay of Naples.

The ecology of Leucothrix mucor and Cristispira were studies in the Bay of Naples. Leucothrix mucor is an epiphyte and is found throughout the Bay. Studies were conducted in relatively pollution-free Ischia and Sorrento and in the polluted waters at Naples between Santa Lucia and Mergellina. Cristispira is a spirochete living in some species of molluscs found in the Bay of Naples. The Bay, though very polluted, was found to still be suitable for the survival of clean water organisms such as Cristispira and Leucothrix. (Ensign-PAI)

THE INFLUENCE OF THE RIVER TYNE ON THE BACTERIOLOGICAL AND CHEMICAL QUALITY OF INSHORE WATERS OF THE NORTH EAST COAST OF ENGLAND,
Newcastle-upon-Tyne Univ. (England). Dept. of Civil Engineering.
P. C. Head, and A. James.
Revue Internationale D'Oceanographie Medicale, Vol 17, p 147-158, 1970. 3 tab, 13 ref.

Descriptors: *Water pollution effects, *Rivers, *Estuaries, *Chemical analysis, *Bacteria, Coliforms, Nutrients, Phytoplankton, Seasons.
Identifiers: Inshore waters, England (North East Coast), *River Tyne.

Chemical and bacteriological surveys have been conducted to determine the effect of domestic and industrial waste discharge on the waters near the mouth of the River Tyne in England. Coliform and Escherichia coli counts have shown that despite die-off and dilution surface layers contain significantly higher numbers of bacteria. The amount of nutrient elements discharged by the river per day is 1000 Kg of nitrogen and silicon, and 100 Kg of phosphorous. During the winter months there was an increase of these elements in the inshore waters. During spring and summer phytoplankton growth resulted in the removal of all the nutrients in the surface waters not directly influenced by the river discharge. In discharge areas higher levels of nutrients and higher standing crops of phytoplankton were found. (Ensign-PAI)

MICROORGANISMS GROWING IN OIL AND OIL PRODUCTS IN WESTERN AND CENTRAL REGIONS OF THE MEDITERRANEAN SEA,
Institute of Biology of the Southern Seas, Sevastopol (USSR).
O. G. Mironov.
Revue Internationale D'Oceanographie Medicale, Vol 17, p 79-85, 1970. 2 tab, 1 fig, 8 ref.

Descriptors: *Oil, *Microorganisms, *Bacteria, *Water pollution effects, Self-purification.
Identifiers: *Mediterranean Sea.

Composition and distribution of species of microorganisms growing in oil and oil products in the Mediterranean were studies. Bacterial growth was effected at 27 degrees C and was observed in 28 out of 54 seawater samples. Thirty nine cultures were separated belonging to the genera Pseudobacterium, Micrococcus, Pseudomonas, Bacterium, and Bacillus. Crude oil and diesel oil were used as the only source of carbon. Relationship was then noted between oil pollution of sea water and occurrence of microorganisms growing in oil and oil products. (Ensign-PAI)

THE DIFFUSION OF BACTERIAL POLLUTION IN THE SEA,
Centre d'Etudes et de Recherches de Biologie et d'Oceanographie Medicale, Nice (France).
M. Aubert, P. Koch, and J. Garancher.
International Conference on Water Pollution Research, Fourth, Proceedings, Prague, Czechoslovakia, April 21-25, 1969, Pergamon Press, New York, p 793-809, 1969. 2 fig, 1 tab, 33 ref.

Descriptors: *Domestic wastes, *Bacteria, *Plankton, *Biomass, *Balance of nature, *Sewage, *Self-purification, Water pollution sources, Water pollution effects.

Investigations were made concerning the diffusion of bacterial pollution in the marine environment. It was deduced that the discharges of domestic waste water into a reconstituted marine environment affect the growth of the planktonic biomass favorably, even when the sewage rate is as high as 20%. At high concentrations these discharges slightly modify the ecological balance and tend to favor the efflorescence of protozoa. Antibiotic action caused by increased planktonic forms has proved to be greater than the bacterial growth enriched with sewage, and this eventually results in their total destruction. (Ensign-PAI)

THE BEHAVIOUR OF BACTERIA IN THE PRESENCE OF PRODUCTS RELEASED BY MARINE PHYTOPLANKTON,
Centre Hospitalo-Universitaire-Poitiers (France).
J. Brisou.
International Conference on Water Pollution Research, Fourth, Proceedings, Prague, Czechoslovakia, April 21-25, 1969, Pergamon Press, New York, p 783-791, 1969. 1 tab, 24 ref.

Descriptors: *Self-purification, *Phytoplankton, *Aerobic bacteria, *Anaerobic bacteria, *Marine plants, Water pollution effects, Metabolism.
Identifiers: Assimilation (Plants).

The possible relationships between phytoplankton and the aerobic and anaerobic microbial populations that exist in the marine environment are studied. This paper specificly discusses experiments relating to the part played by phytoplankton in the self purification of sea water. Marine plants assimilate and reject the products of metabolism, and contain rather characteristic substances. Those products that are apt to be released into the environment and those that are contained within the tissues and can only be released by physical disintegration or by lysis are considered separately. NUTRIENT STUDIES IN HYPER-FERTILIZED ESTUARINE ECOSYSTEMS: I. PHOSPHORUS STUDIES,
Gulf Coast Research Lab., Ocean Springs, Miss.
Walter Abbott.
International Conference on Water Pollution Research, Fourth, Proceedings, Prague, Czechoslovakia, April 21-25, 1969, Pergamon Press, New York, p 729-746, 1969. 2 fig, 6 tab, 41 ref.

Descriptors: *Estuaries, *Pollutant identification, *Nutrients, *Ecosystems, *Model studies, Water pollution effects, Estuarine environment.

Metamorphic data, pond salinities, nutrient levels, P32 distribution and other data were tabulated from a model ecosystem. Eighteen experimental ponds were made by capturing a small bayou channel with cross-levees. This allowed an established estuarine bottom to form in the ponds. Pond volumes were determined by a dye-dilution technique using sodium fluorescein and a fluorimeter. Addition of nutrients, tracers, etc., were made from a skiff with an outboard motor which, when driven in a circular path in the center of the pond stirred the water without disrupting the sediments. ESTIMATION OF THE MAXIMUM DOSE TO MAN FROM THE CONTAMINATION OF AN AQUATIC ECOSYSTEM WITH RADIONUCLIDES,
California Univ., Livermore. Lawrence Radiation Lab.
Arthur R. Tamplin.
Biological Implications of the Nuclear Age, Symposium. Proceedings, Livermore, California, March 5-7, 1969, AEC Lawrence Radiation Laboratory, Bio-Medical Division, Oak Ridge, Tenn, p 77-94, Dec 1969. 2 tab, 1 fig, 19 ref.

Descriptors: *Radioactivity effects, *Ecology, *Aquatic life, *Public health, Aquatic environment, Radioisotopes, Water pollution effects.
Identifiers: Maximum dose estimates.

A method for estimating the maximum internal dose to man, as a possible result of radionuclides released into an aquatic environment is discussed. With this method the nuclides that could contribute most to the internal dose, and determination of the contribution of each nuclide to the total dose, can be identified. The basic objectives of preshot radiation safety analysis and guidance for postshot documentation are accomplished by the results of this method. The analysis is useful as a guide for device design. This study was designed to identify factors in wat
that cause discoloration of white fabrics and
determine if these factors have other damaging e
fects on the fabrics such as loss of strength. T
Kindred area of Cass County, North Dakota, w
selected for the study. Water in this area is ha
and contains iron and manganese in sufficie
quantity to cause staining of white fabrics. All co
and hot water supplies were found to have p
values between 7.0 and 8.8. A Photovolt reflecti
meter was used to determine the whiteness of t
unlaundered swatches and to measure the amou
of discoloration of the laundered swatches. T
swatches showing the greatest increase in perce
of yellowness were laundered in moderately to ve
hard water. In order to determine if the minerals
solution had been detrimental to the fabric, te
were made for breaking strength. After 20 lau
derings, all but two swatches showed a decrease
fabric strength in the length-wise (warp) directio
The swatches having the greatest decrease in fab
strength had been laundered in hot water classifi
as very hard or over 10.5 grains per gallon of har
ness. There was no significant difference betwe
waters samples in the fall, winter and sprin

Identifiers: United Kingdom, Toxic gases, Toxic chemicals, Parasites, Contamination, Health.

Health hazards associated with farm wastes have attained prominence with the development of intensive systems of husbandry. Whilst certain of the problems are unique to intensive systems, most of them are not new. This paper is an attempt to indicate some of them. An account is given of certain hazards to animal health arising from farm wastes, notably slurry and toxic chemicals. Possible ways of limiting these hazards are suggested. A discussion of the paper follows. (See also W71-05747). (Christenbury-Iowa State)

PHYSICAL EFFECTS ON RECEIVING WATERS,
California Univ., Berkeley. Dept. of Civil Engineering.
Robert E. Selleck.
Background Papers on Coastal Wastes Management, prepared for National Academy of Sciences Committee on Oceanography and the National Academy on Engineering Committee on Ocean Engineering, Wash, DC, Vol 1, 1969, p VIII 1-VIII 6.

Descriptors: *Wastes, *Waste water, *Environment, *Oil wastes, Water pollution sources, Water pollution effects.
Identifiers: *Receiving waters, *Surface materials, Surface phenomena, Interfacial phenomena.

The surface or interfacial problems due to foreign matter discharged into the marine and estuarine environment are explained. Films, lenses, scum, foam, and detritus are some of the forms of this surface material. These materials are classed as monolayers and duplex films and the actions, formation, physical effects and approximate relationships of these films are discussed. Natural sea slicks, surface materials of waste water origin and interfacial phenomena are mentioned with suggestions for future investigations on the physical effects of foreign substances on receiving waters. CHEMICAL AND GEOCHEMICAL EFFECTS ON RECEIVING WATER,
Alaska Univ., College. Inst. of Marine Sciences.
Donald W. Hood.
Background Papers on Coastal Wastes Management, prepared for National Academy of Sciences Committee on Oceanography and the National Academy of Engineering Committee on Ocean Engineering, Wash, DC, Vol 1, 1969, p IX 1-IX 45. 4 tab, 41 ref.

Descriptors: *Chemical properties, *Geochemistry, *Wastes, *Sediments, Pesticides, Absorption, River flow, Mining, Oil, Nutrient requirements.
Identifiers: *Receiving waters, *Waste effects.

Man's capacity to destroy the 'inexhaustable' oceans is at last being realized. The cycles in the oceans are very slow. What was predicted as safe a few years ago is no longer proving valid. With this in mind the author discusses some chemical and geochemical effects on receiving water. Chemical properties of waste components affecting their absorption on organic and inorganic particulates and sediments, pesticide uptake by suspended inorganic materials and organic particulate and the exchange coefficients for the sediment - water interface affecting cycling of waste components are included. He also discusses the role of river inflow and chemical scavengers of waste components in the sea, mineral harvesting on chemical character of continental shelf waters and sediments, and the nutrient budget of oceans and estuaries. Neal E. Armstrong, and Philip N. Storrs.
Background Papers on Coastal Wastes Management, prepared for National Academy of Sciences Committee on Oceanography and the National Academy of Engineering Committee on Ocean Engineering, Wash, DC, Vol 1, 1969, p XII 1-XII 40. 2 tab, 49 ref.

Descriptors: *Wastes, *Aquatic life, *Standing crop, *Productivity, *Bioindicators, *Pesticides, *Toxicity, Analytical techniques, Data processing, Application methods.
Identifiers: Microplankton, Zooplankton, Benthic animals, Large invertebrates, Fish, Diversity indices, Biostimulation, Receiving waters.

Background for discussion of the biological effects of waste materials on receiving waters is presented. Quantitative as well as qualitative data is needed in sampling methods. Identification of biological components and determination of numbers per unit area and/or per unit volume of water are of concern. Microplankton, zooplankton, benthos, large invertebrates, fish and microbes are catagorized in this way. Parameters for biological community structure and response are described by standing crop, productivity, diversity indices and indicator organisms. Analytical methods, data processing and application for biota quantification and community structure parameters are described. Assessment and allowable concentrations for toxicity; model prototype simulation, theory and rationale, and kinetics of biostimulation; and definition, problems, exposure, analytical methods, sources, transport, decay and treatment of pesticides are outlined. Existing knowledge is assessed and objectives for further investigations proposed. (See also W71-05787) (Ensign-PAI)

BIOLOGICAL EFFECTS ON RECEIVING WATERS: THE PLANKTON,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
J. D. H. Strickland.
Background Papers on Coastal Wastes Management, prepared for National Academy of Sciences Committee on Oceanography and the National Academy of Engineering Committee on Ocean Engineering, Wash, DC, Vol 1, 1969, p XVII 1-XVI 23. 39 ref.

Descriptors: *Wastes, *Waste water disposal, *Environmental effects, Biology, Ecology, Toxicity, Plankton, Eutrophication.

The reactions of plants and animals to changes in the environment caused by man's activities are considered. A decision as to what is beneficial use of our coastal waters must be made in order to know to what extent their use is being jeopardized. Measuring the biota and its environment in time and space to establish a norm is essential in proving pollution. Twelve months of monitoring of the environment before introducing the foreign matter is necessary. Methods for measuring the biota and the environment, waste water disposal and toxicity assessment are presented. The biology which underlines the phenomena of eutrophication in the sea and effects on the plankton are discussed. (See also W71-05787) (Ensign-PAI)

THE EFFECTS OF THERMAL EFFLUENT ON SOME OF THE MACROFAUNA OF A SUB-TROPICAL ESTUARY,
Florida Power and Light Co.
Richard S. Nugent, Jr.
University of Miami, Sea Grant Program, (Estuarine and Coastal Studies), Sea Grant Technical Bulletin, Number 1, August 1970. 198 p, 29 fig, 19 tab, 145 ref. Sea Grant Technical Bulletin Number 1.

Descriptors: *Estuaries, *Thermal pollution, *Ecology, *Marine animals, Water pollution effects, Florida, Environmental effects.
Identifiers: Turkey Point, *Biscayne Bay.

The effects of heated discharge water from an electric generating facility on the populations of some macrofauna in the waterways of the mangrove region of Biscayne Bay were studied. Qualitative and quantitative investigations were conducted on the kinds, distribution, and abundance of several species of fishes and invertebrates. Hydrological parameters were monitored routinely throughout the study area. Decreased abundance of many species along with other factors indicated that the thermal effluents were detrimental to the animal populations of the area. (Ensign-PAI)

STATE OF THE ART REVIEW ON SLUDGE INCINERATION PRACTICE,
Resource Engineering Associates, Wilton, Conn.
S. Balakrishnan, D. E. Williamson, and R. W. Okey.
Copy available from GPO Sup Doc as I67.13/4:17070 DIV 04/70, $1.25; microfiche from NTIS as PB-197 888, $0.95. Water Pollution Control Research Series, 17070, DIV/04/70, April 1970. 135 p, 20 tab, 40 fig, 61 ref. FWQA, Program 17070 DIV, 04-70.

Descriptors: *Incineration, *Sludge disposal, *Domestic wastes, Solid wastes, Dewatering, *Incineration, *Sludge disposal, *Domestic wastes, Solid wastes, Dewatering, Hydration, Colloids, Centrifugation, Sedimentation, Flotation, Detergents, Biochemical Oxygen Demand, Air Pollution, Waste disposal, Waste water treatment, *Sludge treatment, Reviews.
Identifiers: *Pretreatment, Thickening.

The current status of the incineration art and the associated costs are presented. Principal emphasis is placed upon sludge thickening, sludge conditioning, sludge dewatering, sludge incineration systems, and the design and operation of incinerators. The attitudes of state agencies and consulting engineering firms towards the design and operation of incinerators is included. Conclusions reached are: (1) on-site disposal in limited space requires developments far more efficient in disposing of solids; (2) much improvements in pretreatment steps is essential; (3) addition of other combustible materials may enhance the efficiency of combustion of sludge; and (4) although several systems are currently available there is great need for investigation and updating of the process methods. (Lowry-Texas)

Descriptors: *Activated carbon, *Solids conta process, *Slurries, Pilot plant, Adsorption, Flocc lation, Organic loading, Biochemical oxygen d mand, Chemical Oxygen demand, *Tertiary trea ment, *Waste water treatment, Sludge treatmer Activated sludge.
Identifiers: *Activated sludge plant effluer *Polyelectrolytes, *Clarifier, Regeneration, Reci culation, Counter-current flow, Hydraulic loading

Pilot-scale studies dealing with the use of recirc lating-slurry solids-contact clarifiers in treating a tivated sludge plant effluent were studied. Evalu tion of all available materials led to selection Darco S-51 activated powdered carbon and P rifloc C-32 polyelectrolyte flocculating agent, wi 6 to 7 mg/l of polyelectrolyte required at a carb feed rate of up to 140 mg/l. 30% greater carbon e ficiency, as opposed to a single stage convention unit, was achieved with a single slurry unit, wh results for two series clarifiers were comparable that of two conventional counter-current adsor tion systems requiring multiple agitated tank clarifiers, and filters. Hydraulic loading rat ranged from 0.4 to 1.6gpm/ft sq and influent BO ranged from 23 to 34 mg/l. Dual stage counter-cu rent contactors with 67, 146, and 266 mg/l of ca bon achieved 60, 72' and 84 per cent COD redu tion with residuals of 10.3, 7.4 and 4.4 mg/l respe tively. Estimated costs for a 10 mgd plant with 2 mg/l and 8 mg/l dosages of carbon and polyele trolytes respectively are 15 cents/1000 gal for a mgd plant, and 12.7 cents/1000 gal for a 100 mg plant. Further cost reductions could be possible the event that effluent quality restrictions wou allow a decrease in the carbon dosates. (Lowr Texas)

sults of research conducted as the Columbus boratories of Battelle Memorial Institute on the generation of spent powdered carbon is scribed. The study was directed toward the velopment of a fluidized-bed regeneration hnique in which two systems were investigated. e was a system in which the dried spent carbon s regenerated during its passage through a idized-bed of inert material while the other tem consisted of a pulsating fluidized-bed tem in which the finely divided regenerated car- n served as the bed material. Although both tems restored the spent powdered carbon to % of its original adsorptive capacity and overed 80% by weight, the fluidized inert bed s chosen for larger scale development because of higher unit capacity. A pilot-scale unit was signed and constructed to process 30 pounds of nt carbon in an 8 hour period. This unit was inrated in a powdered carbon adsorption process l tested for 23 days. The results indicated that enerated carbon was as effective as virgin car- n for organic removal for at least 3.6 cycles ough the system. An economic analysis inated that operating costs would be about 1 cent pound for a commercial plant producing 000 pounds of regenerated carbon per day. (El-Texas)

Identifiers: *Biostabilization, Homogenization, Buffers.

Laboratory scale anaerobic digestion studies were carried out to determine the effect of high-shear mixing on the degradation of lipids. The studies showed that the intensity of mixing must be carefully tailored to the rate and type of feed if benefits are to be realized. Dog food, cottonseed oil, and motor oil were fed to the digesters daily as slug loads. When properly operated, the 15 replicate digesters gave reproducible results with good precision. High-shear mixing has little effect on degradation of dog food and was deleterious to lime-buffered solutions heavily loaded with cotton seed oil. When soda ash was used as a buffering agent, heavy loads of oil caused the digester to 'go sour' regardless of the mixing system. Under some conditions homogenization led to serious foaming in the digestors. Kinetic data and chemical analysis of drawdown samples confirmed the hypothesis that homogenization or soda ash buffering can accelerate the hydrolysis of a heavy load offat to a point where the saponification products over load the methane fermentation. Motor oil was not readily digested but did not appear to influence the digestion of cottonseed oil or dog food. Other observations were: (1) more rapid gasification occurs as the feed rate increases; (2) lime and soda ash cannot be used interchangeably as buffers; and (3) feed COD cannot be used to predict methane yield. CONTROL OF WATER POLLUTION FROM SOUTHWESTERN CATTLE FEEDLOTS,
Texas Tech Univ., Lubbock. Water Resources Research Center.
D. M. Wells, W. Grub, R. C. Algin, G. F. Meenaghan, and E. Coleman.
Proceedings, 5th International Water Pollution Research Conference, July-August 1970, Paper II-38. 19 p, 20 tab. FWPCA Demr. Grant 13040, Texas Water Quality Board Contr. IAC (68-69).

Descriptors: *Farm wastes, *Cattle, *Manure, *Runoff, Biochemical oxygen demand, Nutrients, *Aerobic treatment, Anaerobic digestion, Irrigation, Waste water treatment.
Identifiers: *Feedlot runoff, Plant toxicity.

The objectives were to determine the characteristics of solid and liquid wastes resulting from cattle feedlot operations in the southwest U.S., to determine the treatability of these wastes by aerobic and anaerobic treatment systems and to determine whether or not the wastes produced could be used in a beneficial manner for the growing of cash crops. The feedlots studied included concrete-surfaced lots, dirt-surfaced lots, and controlled environmental chambers located on the Texas Tech University campus. Among their conclusions were that within reasonable limits, quality of runoff was not materially affected by type of ration fed or quantity of precipitation. Treatment of runoff resulting from precipitation on beef cattle feedlots is not feasible by conventional treatment systems. Direct application of runoff from concrete-surfaced lots was highly detrimental to the crops they tested. Direct application of runoff from dirt lots had an inhibitory effect on most crops tested except Midland Bermuda grass. Storage of runoff in unlined ponds may result in substantial pollution of the groundwater in the vicinity. They concluded that liquid systems for handling cattle feedlot wastes were not feasible. DISPOSAL OF FARM EFFLUENT,
Ministry of Agriculture, Fisheries and Food, Norwich (England). Veterinary Investigation Center.
E. A. Gibson.
Agriculture, Vol 74, 1967, p 183-188.

Descriptors: *Slurries, *Farm wastes, *Salmonella, Cattle, Hogs, Infection, Incubation, Diseases, Gases, Hydrogen sulfide, Ammonia, Carriers, Waste water treatment, Waste disposal.
Identifiers: *Disease hazard, Anthrax, England, Johnes disease, Avian tuberculosis, Salmonella dublin, Salmonella typhimurium.

The possibility of spreading infection by the use of slurry manure disposal techniques is discussed. It is well known that many infections of farm live-stock are spread in their excreta. Little is known about the effects of such spread as slurry on the land, but under certain circumstances, the use of these systems could increase the disease hazard. Salmonella infection and Johnes disease are discussed in this respect, and anthrax and avian tuberculosis are mentioned more briefly. It is suggested that effluents thought to contain salmonella should not be put on the pasture or fodder crops that will be used for cattle or sheep within six months. The same precaution applies to Johnes disease, except that for cattle up to six months old, the period should be extended to twelve months. These figures may need to be revised as further knowledge and experience is gained. The non-infectious hazards to animal health include the liberation of toxic gases when slurry is agitated or emptied. (White-Iowa State)

DIGESTION TESTS OF LIVESTOCK WASTES,
California Univ., Davis. Dept. of Agricultural Engineering.
Samuel A. Hart.
Journal of the Water Pollution Control Federation, Vol 35, No 6, June 1963, p 748-757. 7 fig, 2 tab, 11 ref.

Descriptors: *Farm wastes, *Poultry, *Cattle, *Sludge digestion, Stabilization, Hydrogen ion concentration, Alalinity, Biochemical oxygen demand, Chemical oxygen demand, Nitrogen, Carbon, Organic matter, Sewage, Odor, Gases, Waste water treatment.
Identifiers: *Dairy cattle, Volatile acids, Digesters, Gas production.

A laboratory test on the digestion of chicken and dairy manures indicates the following: (1) Both chicken and dairy manure would be stabilized satisfactorily in high-rate digesters equipped with adequate sludge-mixing equipment. (2) Dairy manure, because of its high lignin content, will effect organic matter destruction of only 10-15 percent. (3) The destruction of volatile matter expected from digesting chicken manure closely ap-

proximates that of municipal sludge digestion. (4) Operational parameters of pH, alkalinity, volatile acids, and the effect of temperature follow those expected for municipal sludge digestion. (5)Although nitrogen levels of chicken manure are high, digestion does not cause loss of nitrogen, but rather, through destruction of organic matter, it is concentrated to 8 or 9 per cent in the digested sludge. (6) BOD and COD are best expressed in terms of O2/mg VS for the high solids content of manures and manure sludges. (7) COD on a mg O2/mg VS basis increases upon digestion since digestion is a reducing reaction. (8) In total, digestion appears to have merit for stabilizing chicken manure. Consideration would still have to be given to final disposition since digestion does not destroy the waste. (White-Iowa State)

FLUSHING AWAY MANURE PROBLEMS,
Hog Farm Management, Minneapolis, Minn.
Cliff Johnson.
Hog Farm Management, Vol 8, No 1, p 23-25 and 68, January 1971. 7 fig.

Descriptors: *Recirculated water, *Disposal, Farm wastes, Reclaimed water, Lagoons, Hogs, Odor, Labor, Waste water treatment.
Identifiers: *Flushing gutters, Oxidation ditches, Siphon mechanism, Swine, Collection, Automatic dosing siphon.

The flushing gutter system being experimented with at Iowa State University is described. Two variations of the flushing technique, one utilizing a solenoid flushing mechanism and the other a siphon mechanism, have been studied. In the first case, water fills an overhead tank which trips the solenoid causing a plug to lift and thus discharging the tank's contents. For the siphon system, a tank is fitted with 2 1/2 in. N-shaped trap pipe underneath. As the tank fills with water, enough water pressure is built up to force the tank's contents down the pipe into the gutter. The water is discharged rapidly (150 gal. in 62 sec.) through the 2 1/2 in. pipe. Because of the water's force as it is flushed, no dung is left in the gutter after flushing. The gutter is flushed three times per day. Advantages of the system include (1) reduced ventilation requirements, (2) less odor, (3) better feed efficiency, (4) no gas problem, and (5) no labor involved in manure removal. FERTILIZATION OF ANNUAL RANGELAND WITH CHICKEN MANURE,
California Univ., Riverside. Dept. of Agronomy.
Cyrus M. McKell, Victor W. Brown, Robert H. Adolph, and Cameron Duncan.
Journal of Range Management, Vol 23, p 336-340, 1970. 2 fig, 6 tab, 4 ref.

Descriptors: *Poultry, *Grasslands, *Farm wastes, Fertilizers, Costs, Range management, Cost-benefit analysis, Crop response, Phosphorus, California, Proteins, Waste water treatment.
Identifiers: *Chicken manure, Palatability, Rangeland fertilizer.

Where annual rangelands are close to the source of supply, fertilization with chicken manure appears to hold considerable promise in improving the production of forage for grazing. Fertilized polts were ready to be used earlier in forage of a higher quality and palatability. Protein and phosphorus were significantly higher in forage from fertilized plots. Fertilizer value of chicken manure is equal to equivalent rates of commercial fertilizer. There appears to be a slower release of fertilizer elements from chicken manure than from inorganic fertilizer. Annual forage legumes do not appear to benefit initially from the application of chicken manure. In subsequent years following fertilization, the legumes appear to thrive on the increased level of available phosphorus. It was profitable for rangeland operators to fertilize with poultry manure provided they could get it for $3 10 to $4.35 per ton applied. An average of 1,600 pounds of extra feed was obtained for each ton of manure. (Christenbury-Iowa State)

WHIPPING THE MANURE PROBLEM,
Alan Linn.
Farm Quarterly, Winter 1966-1967, p 56-59, 115-116. 4 fig, 2 tab.

Descriptors: *Farm wastes, *Hogs, *Oxidation, *Aerobic bacteria, Labor, Odor, Fertilizer, Value, Organic matter, Carbon dioxide, Water, Nitrogen, Ammonia, Nitrites, Nitrates, Phosphorus, Potassium, Hydrogen sulfide, Methane, Anaerobic bacteria, Aeration, Design standards, Volume, depth, Foaming, Dispersion, Costs, Submergence, Biochemical oxygen demand, Oxygen, Temperature, Waste water treatment.
Identifiers: *Oxidation ditch, *Paddle wheels, Agitation, Circulation, Batch system, Continuous system, Paddle wheel diameter, Slatted floors.

The oxidation ditch is described as an important new breakthrough in manure handling. Advantages of the oxidation ditch include savings in labor, handling manure as a liquid, elemination of almost all odor, and the preservation and concentration of fertilizer nutrients. Basic design standards are given for the ditch and paddle wheel. If the ditch is managed on a continuous basis, 1 1/2 percent of the ditch volume can be added as manure daily. General management requirements and costs are included. The paddle wheel with a 1 1/2 to 3-hp motor costs about $600. The ditch walls can be incorporated into the building's foundation. Estimated power costs are about $1.00 per hog and $8.20 per 1000 pound dairy cow per year. Many changes in confined livestock production through use of the oxidation ditch are contemplated. Identifiers: *Feedlots, *Anaerobic lagoons, Population equivalent, Slug load, Lagoon operation, Biological system, Surface area/volume ratio, Loading parameters, Volatile solids, Detention times.

Even under ideal equilibrium conditions, the liquid effluent from anaerobic lagoons treating livestock and feedlot wastes could pollute a receiving body of water. The quality of the effluent is decreased during the startup operations. The effluent is high in oxygen-demanding material, solids, and nitrogen. Subsequent treatment units are advisabl to remove the solids and most of the oxygen-de manding material. Seasonal temperature variation will alter the effluent quality. The settled solids tha need to be removed periodically from the anaero bic lagoon undergo considerable degradation, sta bilization, and concentration. They are less poten than the entering untreated solids. However, thei quality is such that they should not enter receivin waters. Land disposal offers an acceptable metho of disposal for these solids. Anaerobic lagoons ar not the complete answer to avoiding the pollutio of natural waters by livestock and feedlot waste When used in combination with subsequent units t treat the effluent from the lagoons, anaerobi lagoons may be useful component process fo livestock and feedlot wastes that have a high solid content. THIN SPREADING OF SLURRIED MANURES,
California Univ., Davis. Dept. of Agricultural E gineering.
Samuel A. Hart.
Transactions of the American Society of Agricu tural Engineers, Vol 7, 1964, p 22-28. 9 fig, 3 ta 21 ref.

Descriptors: *Farm wastes, *Slurry, *Drying, Ca tle, Hogs, Poultry, Moisture content, Viscosit Pumps, Bulk density, Volume, Nitrogen, Odor, O ganic matter, Carbon dioxide, Waste water trea ment.
Identifiers: *Spreading, *Thin spreadin *Fluidization, Liquefaction, Solids per cent, F breeding, Slump, Layers, Layer thickness, Surfac area.

The purpose was to determine how thick a layer manure could be spread, day after day, layer upo layer, and still prevent fly breeding or other sanit tion problems. Chicken and dairy manure w fluidized to 10 to 20 percent solids, and then spre in layers on two sets of six plots. The six plots each series were dosed with increasing thickness of manure: from 1/25 to 1/4 inch for the chicke plots; 1/20 to 3/10 inch for the dairy plots. specific plot received the same dose at each of th 47 applications. At a solids content of 85 percen fly breeding was prevented. A significant amount organic matter is lost during drying and storage, th loss being related to the moisture content of th

ot. One-half of the nitrogen originally present in e manure is also lost. The land area needed for mulative layering is not large - less than 200 sq. per cow and 1 sq. ft. per chicken. Odors can and occur in manure thin spreading, but can be nimized by layering of fresh manure only. Vhite-Iowa State)

Identifiers: *Loading rates, *Physical appearance, Surface area, Total solids, Volatile solids, Volatile acids, Fly activity, Crusting, Pilot lagoons, Materials balance, BOD reduction, Sludge seed.

The need for more closely controlled tests of a laboratory type concerning livestock manure lagoons prompted this study. Eight concrete ringed pilot lagoons four feet in diameter and seven feet were used in the experiment. The units were fed poultry, dairy and cattle manure during the two year test. Chemical and physical properties were monitored weekly and are presented in tabular form. Infiltration from the packed earth bottom was considerable. This hampered the accurate determinations needed for a materials balance. Appearance, odors, and fly activity were noted. A section tells how to use the knowledge gained from the experiment. It is felt that with proper construction, property loading rates, and proper operation, lagoons can be expected to be satisfactory. (White-Iowa State)

TREATMENT OF LIVESTOCK WASTE -- A LABORATORY STUDY,
Missouri Univ., Columbia. Dept. of Sanitary Engineering; and Missouri Univ., Columbia. Dept. of Agricultural Engineering.
E. A. Jeffrey, W. C. Blackman, and Ralph Ricketts.
Transactions of the American Society of Agricultural Engineers, Vol 8, No 1, 1965, p 113-117, 126. 6 fig, 5 tab, 17 ref.

Descriptors: *Farm wastes, *Lagoons, *Anaerobic digestion, *Hogs, Aerobic treatment, Lagoons, Cattle, Sheep, Aeration, Sludge, Domestic wastes, Hydrogen ion concentration, Digestion tanks, Biochemical oxygen demand, Chemical oxygen demand, Waste dilution, Nitrification, Manometers, Design standards, Design criteria, Waste water treatment.
Identifiers: *Aerobic lagoon, Agitation, Volatile solids, Total solids, Beuch scale aerators, BOD/COD ratio, Detention time.

A study was made of the aerobic and anaerobic digestion characteristics of livestock wastes. The results obtained in the hog waste digestion studies are compared to design criteria for domestic sludge digestion units. Design loading conditions and water requirements are calculated for using an anaerobic lagoon for treating hog wastes. Design requirements for an aerobic lagoon are also indicated. It is concluded that disposal of hog wastes by use of aerobic lagoons is prohibitive because of the large requirements of both water and land area. The use of anaerobic lagoons is feasible, but it is accompanied by the problem of eventually having to dispose of the accumulated digested sludge. Future studies should be made on the operation of series lagoons. By using the first lagoon for settling and as an anaerobic lagoon, the area requirement of the second to serve as an aerobic lagoon would be greatly reduced, perhaps to the point of practicality. (White-Iowa State)

TREATMENT OF FARM EFFLUENTS,
Water Pollution Research Lab., Stevenage (England).
A. B. Wheatland, and B. J. Borne.
Chemistry and Industry, February 29, 1964, p 357-362. 5 tab, 7 ref.

Descriptors: *Farm wastes, *Cattle, *Hogs, *Waste water treatment, Surface runoff, Volume, Water pollution, Biochemical oxygen demand, Cooling water, Carbon, Nitrogen, Nitrate, Effluents, Sewage, Filtration, Irrigation, Farm ponds, Silage, Organic matter, Biological treatment, Septic tanks.
Identifiers: *England, *Dairy cattle, Pollutional strength, Milking parlors, Permanganate, Recirculation, Land disposal, Soakaways, Chemical treatment.

Sources, volumes, and strength characteristics of farm effluents are discussed. A major portion deals with dairy and waste water effluents, coming from milking parlors and holding pens. Chemical and physical properties are listed in tabular form. Hog wastes and silage liquor are mentioned briefly as effluent sources. Treatment methods discussed include disposal on land, discharge to a sewer, biological treatment, septic tanks and chemical treatment. Disposal on land may be accomplished by use of tankers, soakaways, or irrigation. The use of storage ponds facilitates the latter. (White-Iowa State)

FUMIGATION AND REUSE OF BROILER LITTER,
Hawaii Univ., Honolulu. Dept. of Animal Sciences.
Ernest Ross.
Poultry Science, Vol 47, 1968, p 1711-1712.

Descriptors: *Farm wastes, *Poultry, *Fumigants, Broods, Performance, Mortality, *Waste treatment.

Identifiers: Weight gains, Feed conversion, Reused litter, Litter, Methyl bromide.

A series of experiments was conducted to compare the performance of broiler chicks reared on fresh and reused wood shavings litter. In addition, the effect of methyl bromide fumigation of reused litter on subsequent chick growth, feed conversion and mortality was studied. Non-fumigated fresh and reused litters served as controls. Methyl bromide fumigation reduced the total bacterial population of reused litter. This reduction, however, did not result in any significant improvement in body weight gains, feed conversion or mortality. The performance of the chicks reared on the fumigated litter was similar to that of chicks reared on reused litter and slightly superior to that of chicks reared on fresh wood shavings litter. The mortality o f chicks reared on fresh litter was slightly lower than in the groups on the reused litters. (White-Iowa State)

Descriptors: *Farm wastes, *Pigs, Aerobic conditions, Oxygen requirements, Waste water treatment, Biochemical oxygen demand, Chemical oxygen demand, Hydrogen ion concentration, Waste disposal.
Identifiers: *Swine wastes, *Oxidation ditch, Rotor capacity.

The object was the evaluation of an oxidation ditch for the treatment of swine manure. The oxidation ditch was constructed as part of the foundation for each building. Slotted floors permitted the manure to discharge directly from the animal into the treatment unit. Data were collected at weekly intervals from September, 1966 to August, 1967. The data indicated that the oxidation ditch could treat swine manure without odor nuisances. These units were able to reduce the soluble BOD to less than 10 milligrams per liter with a total effluent BOD of about 1,200 milligrams per liter. The effluent also contained considerable salts in addition to the suspended solids. It was necessary that the treated effluent be discharged into cultivated fields rather than being discharged into the adjacent drainage ditch. A holding pond was used to store the discharge of the treated effluent prior to spreading on nearby fields. (Miner-Iowa State)

ION EXCHANGE OF WASTE WATER FROM THE FOODSTUFF INDUSTRY,
Royal Danish School of Pharmacy, Copenhagen. Chemical Lab. A.
Sv. E. Jorgensen.
Vatten, Vol 4, p 350-357, 1970. 6 tab, 2 fig, 11 ref.

Descriptors: *Waste water treatment, *Precipitation, *Ion exchange, *Organic matter, Proteins, Phosphates, Nitrates, Carbohydrates.
Identifiers: *Polypeptides, *A-amino groups, *Foodstuff industry waste treatment.

A purification process for waste water from foodstuff industries by precipitation with glucose trisulphate and three ion exchangers was analyzed and is described. Proteins with high molecular weight were removed and the number of free a-amino groups are reduced by precipitation. The first ion exchanger also removes proteins but the substantial reduction of the number of a-amino groups is done by a cationic exchanger. This ion exchanger removes polypeptides of lower molecular weight and ammonia. A chelated anionic exchanger then removes low molecular polypeptides, phosphates, nitrates and carbohydrates. Eperimental conditions, and analytical methods for the ion exchange processes and elution are described in detail. (Ensign-PAI)

FUNGI ASSOCIATED WITH THE ACTIVATED-SLUDGE PROCESS OF SEWAGE TREATMENT AT THE LEBANON, OHIO, SEWAGE-TREATMENT PLANT,
Robert A. Taft Water Research Center, Cincinnati, Ohio. Advanced Waste Research Lab.
William Bridge Cooke.
The Ohio Journal of Science, Vol 70, No 3, p 129-146, May 1970. 2 fig, 8 tab, 11 ref.

Descriptors: *Pseudomonas, *Yeasts, *Activated sludge, *Sewage treatment, Ohio, Cultures, Hydrogen ion concentration, Dissolved oxygen, Biochemical oxygen demand, Carbon, Suspended load.
Identifiers: Total organic carbon.

Samples of materials in various stages of sewage treatment were obtained at monthly intervals between October, 1967, and April, 1968, from the Lebanon, Ohio, sewage-treatment plant. A total of 93 species or species groups of fungi, including filamentous and yeast-like types, was recovered from both secondary and tertiary processes. Sampling and isolation techniques and data for several chemical and physical measurements made on the samples are presented. Effluent from the activated sludge aerator contained a ratio of 41 bacteria to one fungus, in contrast to a ratio of 1430 bacterial cells to one fungus cell in raw sewage. (Little-Battelle)

GEOMETRIC PROGRAMMING AND THE PRELIMINARY DESIGN OF INDUSTRIAL WASTE TREATMENT PLANTS,
Rensselear Polytechnic Inst., Troy, N.Y. Dept. of Mathematics; and Union Coll., Schenectady, N.Y. Dept. of Economics.
J. G. Ecker, and J. R. McNamara.
Water Resources Research, Vol 7, No 1, p 18-22, February 1971. 5 p, 3 tab, 5 ref. NSF grant GP 15031.

Descriptors: *Optimization, *Dynamic programming, *Industrial wastes, *Waste treatment, *Design, Water quality, Cost, Stream improvement.
Identifiers: *Geometric programming.

The use of a new optimization theory termed 'geometric programming' was compared to the use of dynamic programming for preliminary design of industrial waste treatment plants. In a recent paper Shih and Krishnan used a dynamic programming approach to designing a waste treatment plant operating on pulp and paper manufacturing wastes that provided a required effluent quality in terms of percent of 5-day (first stage) biochemical oxygen demand (BOD) removed at minumum total annual cost. This cost, assumed constant over time, was composed of construction amortization costs, insurance costs, and operation costs. Then the geometric programming was proposed which used Program A in association with program B forming a 'dual' program relationship where one program was studied through properties of the other. Since the optimal value of program A equaled the optimal values, of B, finding a minimizing vector for program A relied on solving program B first. For the design problem under consideration, the dual program B was solved by associating it with various designs. Detailed calculation for design 1, a combination of four processes in series: primary clarification, trickling filter, activated sludge with secondary clarification, and carbon adsorption, illustrated the procedure. It was shown that geometric programming plays an important role in large stream quality problems. (Kriss-Cornell)

DISPOSAL OF WASTES FROM SWINE FEEDING FLOORS TO MINIMIZE STREAM POLLUTION,
Maryland Univ., College Park. Dept. of Agricultural Engineering.
W. F. Schwiesow, H. L. Brodie, and H. J. Eby.
Available from NTIS as PB-198 028, $3.00 in paper copy, $0.95 in microfiche. Completion Report, University of Maryland, Water Resources Research Center, January 1970. 11 p. OWRR Project A-004-MD (1).

Descriptors: *Farm wastes, *Water pollution sources, *Pigs, *Septic tanks, Digestion tanks, Sedimentation tanks, Soil disposal fields, *Waste disposal, Waste water treatment.
Identifiers: *Flushing gutters, Swine manure.

This research was to investigate the feasibility of a septic disposal system with an underground distribution system as a means of eliminating runoff from swine feeding floors into the surface waters. Installation provided for hydraulic cleaning of the feeding floor. Manure, water and uneaten feed was washed into gutters, one on each side of the house. Modifications included the addition of a 7,000 gallon tank, a 1,200 gallon tank and connecting 4 inch PVC pipe. Six hundred feet of perforated plastic drain lines were located near the tanks. It was soon evident that the large tank intended to serve as a septic tank was inadequate and performed primarily as a sedimentation tank. Data taken showed this tank was satisfactory for accumulating solid wastes for a period of about 5 weeks. Solids were removed by mechanical means. Tests on the tile distribution system showed that the capacity to dispose of the liquid effluent was more than needed. Proper operation should provide a satisfactory means of disposing of the liquid portion of the wastes without polluting the nearby river. (Miner-Iowa State)

A REPORT ON THREE MANURE COMPOSTING PLANTS,
Public Health Service, San Francisco, Calif.
John S. Wiley.

mpost Science, Vol 5, Summer 1964, p 15-16. 3

escriptors: *Farm wastes, Public health, Cattle, ultry, Organic wastes, Aerobic conditions, naerobic conditions, Mositure content, Aeration, lor, Pathogenic bacteria, Screens, Nitrogen, Amnia.
ntifiers: *Composting, *Aerobic decomposin, Nuisance, Fly production, Windrow compost-, Rotary drum composter, Soil conditioner.

e article describes three manure composting nts which process manure in a sanitary, nomical manner and use the product as a soil nditioner. One plant treats a mixture of feedlot nure from 5500 steers and meat packing wastes long windrows which are turned six times during six week composting period. The other two nts treat poultry manure in rotary drum comsters. Each of these two plants treats wastes from million birds. The compost is sold as a humus nt food. The three plants are interesting atnpts to process manures in a sanitary manner d to utilize the resulting product for the benefit he soil. (White-Iowa State)

ntifiers: *Poultry litter, *Feedstuffs, Enrichment oths, Selenite broth, Animal by-products, Feed ls, Rendering plants, Tetrathionate broth, Sigicant difference, Proteus.

comparison of several different culture ocedures for Salmonella isolations, using enite-brilliant green-sulfapyridine (SBG sulfa) d tetrathionate brilliant green (TBG) as enhments was made with 198 litter samples of ich 161 were positive by one or more methods, d with 371 animal feedstuff samples of which d were positive by one or more methods. All enhments were streak-plated after 48 hour incuban. SBG sulfa incubated at 43C was superior to G sulfa at 37C, and to TBG at 37C with or hout pre-enrichment for the isolation of salmonellae from poultry litter and animal feedstuffs. Significantly more samples of animal feedstuffs yielded salmonellae from SBT sulfa at 43C than from the other two media. More salmonella colonies and fewer competing organisms were usually obtained on BG agar plated from SBG sulfa at 43C than from either SBG sulfa at 37C or TBG. SBG sulfa appeared to be a more favorable enrichment medium than TBG for isolating S. senftenberg; differences in the number of isolations among several other serotypes were too small for comparison. CHEMICAL AND BIOLOGICAL REACTIONS FROM LAGOONS USED FOR CATTLE,
Wisconsin Univ., Madison.
S. A. Witzel, Elizabeth McCoy, and Richard Lehner.
ASAE Paper No 64-417. Transactions of the American Society of Agricultural Engineers, Vol 8, p 449-451, 1965. 1 fig, 16 ref.

Descriptors: *Oxidation lagoons, *Biochemical oxygen demand, *Anaerobics, Algae, Bacteria, Water pollution sources, Odor, Farm waste, Sludge, Solid wastes, Decomposting organic matter, Lagoons, Cattle.
Identifiers: Organic nitrogen, Bacteriological study, Aerobicity.

An experimental lagoon to receive the wastes as liquid manure from six bulls was constructed. In an experimental barn the manure from the bulls was washed daily into two gutters 24 in. wide at the top. The gutters had a capacity of 2000 gallons. The gutters were flushed every seven days into a lagoon. The circular lagoon had a 60 ft diameter at the top, a 40 ft diameter at the bottom and was 5 ft deep. Liquid manure samples were taken from the barn gutter and from the lagoon manure liquid and sludge. BOD tests were conducted on all samples and the percent BOD reduction from gutter to lagoon was calculated. Other tests were made to determine percent total solids removal, organic nitrogen content, pH values, and temperature. Extensive tests were made and reported on bacteria content, both quantitative and qualitative. Five conclusions of the study are mentioned. (Parker-Iowa State)

ARTHROPOD PREDATORS OF IMMATURE DIPTERA DEVELOPING IN POULTRY DROPPINGS IN NORTHERN CALIFORNIA: PART II,
California Univ., Berkeley. Dept. of Entomology and Parasitology.
John H. Peck.
Journal Medical Entomology, Vol 6, No 2, p 168-171, May 31, 1969. 4 tab, 15 ref.

Descriptors: *Poultry, *Diptera, California, Seasonal, Predation, Mites, Mortality, Insect eggs, Larvae, Light, Farm wastes.
Identifiers: *Arthropod predators, Predation potential, Media cohabitation, Pupae, House fly eggs, Variance, Poultry droppings.

The feeding responses of 3 species of predaceous Staphylinidae and 2 species of predaceous Histeridae were studied by exposing them to eggs, larvae and pupae of Musca domestica and Fannia femoralis. Studies of age-of-prey specific predation by M. muscaedomesticae on immature M. domestica showed that most mortality was inflicted on eggs and first instar larvae. Predation rates were determined for the above and 6 other predaceous species; the following indices of predation potential were computed for the 5 most abundant predators: Fuscuropoda sp. (adults) - 3.5, Glyptholaspis confusa females - 4.4, Macrocheles muscaedomesticae females - 95.8, Carcinops pumilio (adults) - 97.0, and Ophyra leucostoma L3 - S226.4. The potential importance of the above predators is discussed with reference to their seasonal and media cohabitation with various prey species. (See also W71-05743). (White-Iowa State)

TWO BILLION TONS OF - WHAT,
Department of Agriculture, Beltsville, Md. Livestock Engineering and Farm Structures Research Branch.
Harry J. Eby.
Compost Science, Vol 7, p 7-10, Autumn 1966. 2 fig.

Descriptors: *Farm wastes, *Volume, *Organic wastes, Domestic wastes, Cattle, Poultry, Nutrients, Value, Organic matter, Topsoil, Turf, Water pollution, Percolation, Fertilizers, Filters.
Identifiers: *Waste production, *Grass belts, *Composting, Population equivalent, Land disposal, Pollution control.

The author advocates managing our millions of tons of organic waste, both farm and municipal, in such a way that grass belts would be planted along the borders of streams and rivers. The organic wastes would be worked into these areas in large quantities to improve the quality of the soil. His proposal is based on three factors: (1) Soil with a high organic content holds more water than soils with little organic content. (2) Incorporating organic matter into a clay soil improves its percolation rate as well as its water-holding capacity. (3) Soil is a good bacterial filter. Thus the grass belts would act as a means of stream and river pollution control. The author feels that more research is needed to find components of manure which would have continuing industrial or commercial applications. Examples are given illustrating the magnitude of the animal waste disposal problem. (White-Iowa State)

FARM WASTES.

Proceedings of Symposium, Farm Wastes, The Institute of Water Pollution Control, The University of Newcastle upon Tyne, 1970. 148 p.

Descriptors: *Farm wastes, Disposal, Legislation, Slurries, Composting, Disease, Legal aspects, Hazards, Toxicity, Public health, Odors, Costs, Design criteria, Treatment, Adsorption, Reverse osmosis, Confinement pens, Hogs, Equipment, Microorganisms, Farm lagoons, Irrigation, Aeration, Aerobic treatment, Anaerobic treatment, Biochemical oxygen demand, Chemical oxygen demand, Biological treatment.

Identifiers: Health, Public nuisance, Population equivalents, Swine, Slatted floors, Oxidation ditch, Flushing gutter, Systems, Gas production, United Kingdom.

The two day symposium was attended by over 200 delegates including representatives from local authorities, river authorities, universities, agricultural colleges and research stations, nationalized industries and consultants. The various Ministries were well represented, with over 60 delegates. Those attending included delegates from Canada, Denmark, Eire, Holland and the United States. Nineteen technical papers were presented. A discussion of each paper is included. Four sessions were conducted: An introductory session, 4 papers; Problems off the farm, 3 papers; Minimizing the waste problem, 7 papers; and Waste treatment and disposal on the farm, 5 papers. (See also W71-05748 thru W71-05766). (Christenbury-Iowa State)

THE PROBLEM OF DISPOSAL OF FARM WASTES, WITH PARTICULAR REFERENCE TO MAINTAINING SOIL FERTILITY,
National Agricultural Advisory Service, Bristol (England). Soil Science Dept.
C. Berryman.
Proceedings of Symposium: Farm Wastes: The Institute of Water Pollution Control and The University of Newcastle upon Tyne, Paper No 3, p 19-23, 1970. 4 tab, 4 ref.

Descriptors: *Disposal, *Slurries, *Fertility, Farm wastes, Anaerobic conditions, Nutrients, Irrigation, Value, Fertilizers, Waste disposal.
Identifiers: *Animal slurry, *Composition, Organic irrigation.

This paper reviews the effect of farm waste, particularly in the form of animal slurry, on soil fertility. Slurry can supply an important part of the NPK requirements on the farm. The application of slurry to land is the most convenient and practical method of disposal, but problems due to a breakdown of soil structure can occur if an unsuitable soil receives excessive applications of slurry. The soil type is important when assessing the effect slurry disposal will have on the fertility of soil. (See also W71-05747). (Christenbury-Iowa State)

SEWERS AND SEWAGE TREATMENT,
Chartered Civil Engineers, London (England); Newcastle-upon-Tyne Univ. (England).
James R. Simpson, and R. L. Hibberd.
Proceedings of Symposium: Farm Wastes: The Institute of Water Pollution Control and The University of Newcastle upon Tyne, Paper No 7, p 44-51, 1970. 2 fig, 2 tab, 13 ref.

Descriptors: *Costs, *Design criteria, *Sewage treatment, Farm wastes, Biochemical oxygen demand, Legislation, Dissolved solids, Tertiary treatment, Sewers, Activated sludge, Capital cost.
Identifiers: River authority, Loading rates, Mogden formula, United Kingdom, Population equivalents, Suspended solids.

The purpose of this paper is to aquaint those unfamiliar with sewerage and sewage treatment with the general nature of the systems and processes. References to more detailed descriptions of the processes are included. Further, an attempt is made to answer the questions, 'Why and to what extent would a discharge with given characteristics affect the design of the sewers and the sewage-treatment works, and at what cost.' A formula for allocating waste treatment cost to agriculture is discussed. A discussion of the paper is included. (See also W71-05747). (Christenbury-Iowa State)
W71-05754

MINIMIZING THE WASTE DISPOSAL PROBLEM IN VEGETABLE PROCESSING,
Electricity Council Research Center, Capenhurst (England).
F. Barrett.
Proceedings of Symposium: Farm Wastes: The Institute of Water Pollution Control and The University of Newcastle upon Tyne. 1970. Paper No 8, p 57-65. 7 fig, 4 tab.

Descriptors: *Apparatus, *Adsorption, *Reverse osmosis, Farm wastes, Desalination, Chemical oxygen demand, Recirculated water, Aeration, Flotation, Chlorination, Ultraviolet radiation, Biochemical oxygen demand, Equipment, Ozone, Biological treatment, Sludge disposal, Treatment.
Identifiers: *Food processing, Sterilization, Ozonation, United Kingdom, Vegetable processing.

This paper discusses possible mentods of treating waste from vegetable processing plants. The results obtained from a coagulation/flocculation unit have been encouraging. An aeration tower complex has been utilized for biological treatment. A pilot-scale adsorption unit and a reverse osmosis unit have been designed, built, and evaluated. A discussion and the reply to the discussion follows on page 106-109. (See also W71-05747) (Christenbury-Iowa State)
W71-05755

MINIMIZING POULTRY WASTE PROBLEMS,
National Agricultural Advisory Service, London (England).
C. T. Riley.
Proceedings of Symposium: Farm Wastes: The Institute of Water Pollution Control and The University of Newcastle upon Tyne. 1970. Paper No 9, p 66-72. 3 fig, 5 tab, 1 ref.

Descriptors: *Farm wastes, *Poultry, *Disposal, Costs, Biochemical oxygen demand, Odor, Land use, Sludge, Chemical properties, Physical properties, Fertilizers.
Identifiers: Composition, Hatchery waste, Broilers, United Kingdom.

This paper is divided into two parts; first an assessment of the industry and second an approach to some current problems. Manure from cage layers represents the major disposal problem in the poultry industry today. The physical and chemical properties of waste is given. In the main, poultry waste has to be returned to the land in some form. The disposal of manure from laying batteries is discussed in relation to minimizing the poultry-waste problems. Whether to handle the manure as a solid or liquid is examined. A discussion and reply to the discussion follows on page 106-109. (See also W71-05747) (Christenbury-Iowa State)
W71-05756

MINIMIZING THE WASTE PROBLEM WITH PIGS,
National Agricultural Advisory Service, London (England).
C. G. Pointer.
Proceedings of Symposium: Farm Wastes: The Institute of Water Pollution Control and The University of Newcastle upon Tyne. 1970. Paper No 10, p 73-80. 7 fig.

Descriptors: *Confinement pens, *Design standards, *Hogs, Farm wastes, Slurries, Odor, Cleaning.
Identifiers: *Swine, Slatted-floor, Slurry systems, Sow feeders, Fattening house, Farrowing, United Kingdom, Manure handling, 'Ad-lib' feeding.

The first step towards minimizing the problems will be in the choice of site for the new pig unit. The larger the unit the more critical this decision will be. Subsequently the management and housing systems selected must be suited to the site. Systems have been described in this paper which minimize the problems. In existing problem units common sense and discretion can often avoid acute situations developing. It is hoped that economic solutions for these units will be evolved. In any event, there is always likely to be some smell from a piggery. A discussion and the reply to the discussion follows on page 106-109. (See also W71-05747) (Christenbury-Iowa State)
W71-05757

MINIMIZING THE WASTE PROBLEM WITH CATTLE,
Newcastle-upon-Tyne Univ. (England).
M. M. Cooper.
Proceedings of Symposium: Farm Wastes: The Institute of Water Pollution Control and The University of Newcastle upon Tyne. 1970. Paper No 11, p 81-83.

Descriptors: *Farm wastes, *Slurries, *Disposal, Cattle, Costs, Confinement pens.
Identifiers: *Cubicle system, Cowtels, United Kingdom.

This paper discusses some of the changes taking place in the cattle industry and the requirements for waste disposal. Many cattle producers require confinement areas for cattle for at least part of the year. Some of the systems being utilized for waste disposal are discussed. A discussion and the reply to the discussion follows on page 106-109. (See also W71-05747) (Christenbury-Iowa State)
W71-05758

BUILDING DESIGN,
Chartered Architects, London (England).
J. B. Weller.
Proceedings of Symposium: Farm Wastes: The Institute of Water Pollution Control and The University of Newcastle upon Tyne. 1970. Paper No. 12, p 84-93. 2 fig, 6 tab.

Descriptors: *Farm wastes, *Cost comparisons, *Disposal, Management, Slurries, Design criteria, Gases, Farm lagoons, Buildings, Storage tanks, Storage capacity, Livestock, Treatment.
Identifiers: United Kingdom, Slatted floors, Perforated floor, Cubical-house, Bacon house.

This paper discusses some design criteria for animal housing. The first portion of the paper deals with the management factors that must be considered, such as type of manure, quantity, disposal method, bedding, and cost. The remainder of this paper examines some of the implications regarding actual building types. There is a comprehensive table giving the definitions and requirements for the management of slurry and manure from livestock. A cost analysis of the various possible disposal systems is presented. A discussion and the reply to the discussion follows on page 106-109. (See also W71-05747) (Christenbury-Iowa State)
W71-05759

BUILDING DESIGN AND MANURE DISPOSAL,
Institutt voor Landbouwbedrijfsgebouwen, Wageningen (Netherlands).
J. C. Glerum, A. P. S. De Jong, and H. R. Poelma.
Proceedings of Symposium: Farm Wastes: The Institute of Water Pollution Control and The University of Newcastle upon Tyne. 1970. Paper No 13, p 94-100. 3 fig, 3 tab.

Descriptors: *Farm wastes, *Disposal, *Costs comparison, Cattle, Storage tanks, Slurries, Storage capacity, Design criteria.
Identifiers: Mucking-out, Mixed storage, Separate storage, Animal housing, Cubicle house.

In general, slurry systems are preferable to system for handling solids and urine separately. Special reasons, for example difficulty in disposing of the manure, can cause separate storage to be used. If mixed storage is used the layout of the building must be adapted to the specific requirements of this system. Altering the buildings afterwards will usually be very expensive. The high capital cost of the slurry system will often be a drawback; this is especially the case for cowhouses where a considerable storage capacity is required. A discussion and the reply to the discussion follows on page 106-109. (See also W71-05747) (Christenbury-Iowa State)

ntifiers: *Oxidation ditch, *Flushing gutter, nure removal.

full-scale study of the possibility of renovating ne manure for use in manure transport was car-d out. Preliminary anaerobic treatment and set-g took place in a lagoon followed by secondary atment in an oxidation ditch. Measurements of D, BOD, nitrogen, solids and certain inorganic ts were made during the period February to May 69. Assessment of the results showed that the tem had considerable promise from the stand-nt of confinement house environmental im-ovement and labour reduction. A stable and sani-y effluent was obtained at all times which owed no adverse effects upon the performance of animals exposed to it. Rainfall precluded useful ormation being obtained concerning salt build-or toxicity in the treatment system. No toxicity ects were apparent after continuous operation 20 weeks. The test was terminated because of chanical failures. A discussion and the reply to discussion follows the paper on page 106-109. e W71-05747) (Christenbury-Iowa State)

ND DISPOSAL AND STORAGE OF FARM ASTES. 2. HANDLING AND DISTRIBUTION,
tional Agricultural Advisory Service, London ngland). National Livestock Mechanization Spe-list.
Payne.
oceedings of Symposium: Farm Wastes: The In-ute of Water Pollution Control and The Univer-of Newcastle upon Tyne. 1970. Paper No 16, p 5-121. 1 fig, 2 tab, 1 ref.

scriptors: *Farm wastes, *Mechanical equip-nt, *Distribution, Slurries, Disposal, Treatment, rage, Costs, Cattle, Irrigation.
ntifiers: *Handling, Removal, Solid manure, Or-ic irrigation.

The mechanization aspect of applying farm effluent to the land is governed by the physical state of the effluent, the stock housing system and the type of farm on which the stock enterprise is situated. Consequently three basic systems of handling manure onto the land have evolved. These are handling it as a solid manure, as a dense slurry, and as a diluted slurry. This paper discusses the equipment required for each of the handling systems. In general, if the manure can be kept solid the problems will be fewer. AEROBIC TREATMENT OF FARM WASTES,
North of Scotland Coll. of Agriculture, Aberdeen. Scottish Farm Buildings Investigation Unit.
K. Robinson, S. H. Baxter, and J. R. Saxon.
Proceedings of Symposium: Farm Wastes: The Institute of Water Pollution Control and The University of Newcastle upon Tyne. 1970. Paper No. 17, p. 122-131. 1 tab, 9 fig, 26 ref.

Descriptors: *Aeration, *Mechanical equipment, *Aerobic treatment, Farm wastes, Odor, Slurries, Ventilation, Farm lagoons, Biochemical oxygen demand, Hogs, Chemical oxygen demand, Microorganisms, Dissolved oxygen, Laboratory tests, Waste water treatment.
Identifiers: Oxidation ditch, Aeration lagoon.

This paper is divided into two main sections - a review of existing commercially available methods of aerobic waste disposal and an outline of the project in Aberdeen for the study of pig-waste treatment. The review is limited to a description of aerobic methods and no specific attempt has been made to compare the relative merits of these systems, since a critical examination of some of them is one of the aims of our project. The characteristics of pig waste, its oxygen demands, and the influences of copper on bacterial activity are discussed. The factors influencing the growth and metabolic activity of micro-organisms are outlined and the problems of satisfactory methods of laboratory determinations are emphasized. ANAEROBIC TREATMENT OF FARM WASTES,
West of Scotland Agricultural Coll., Glasgow. Dept. of Bacteriology.
Selwyn Baines.
Proceedings of Symposium: Farm Wastes: The Institute of Water Pollution Control and The University of Newcastle upon Tyne. 1970. Paper No. 18, p 132-137. 1 tab, 20 ref.

Descriptors: *Farm wastes, *Anaerobic digestion, Anaerobic conditions, Anaerobic bacteria, Microorganisms, Sludge, Slurries, Mixing, Hydrogen ion concentration, Biochemical oxygen demand, Digestion, Design data, Methane, Waste water treatment.
Identifiers: Commercial applications, Gas production.

This paper describes the effects of anaerobic treatment and its application to farm wastes. A satisfactory methane fermentation can be established and maintained. The digested sludge is relatively inert, free from nuisance and more amendable to dewatering. The anaerobic digestion process also reduces the risk of pathogenic organisms causing human or animal diseases. The design and operation of an anaerobic treatment process is described. Several reports from commercial installations are included. (See also W71-05747) (Christenbury-Iowa State)

TREATMENT OF FARM WASTES,
Instituut voor Landbouwbedrijfsgebouwen, Wageningen (Netherlands).
H. M. J. Scheltinga, and H. R. Poelma.
Proceedings of Symposium: Farm Wastes: The Institute of Water Pollution Control and The University of Newcastle upon Tyne. 1970. Paper No 19, p 138-142. 3 tab, 3 fig.

Descriptors: *Farm wastes, *Biological treatment, *Aerobic treatment, Farm lagoon, Activated sludge, Aeration, Slurries, Biochemical oxygen demand, Sludge, Cost comparison, Waste water treatment.
Identifiers: Oxidation ditch, Pasveer ditch.

This paper is related to biological treatment of farm animal waste. Aerobic treatment is described. A schematic of an oxidation ditch and an aeration pit is included. The economic aspect of the oxidation ditch versus the aeration pit is presented. A discussion of the paper is included. (See also W71-05747) (Christenbury-Iowa State)

ECONOMIC ASPECTS OF SOLID WASTE DISPOSAL AT SEA,
Massachusetts Inst. of Tech., Cambridge.
J. W. Devanney, III, V. Livanos, and J. Patell.
Sea Grant Project Office, Report No, MITSG 71-2, November 20, 1970. 124 p, 12 fig, 71 ref.

Descriptors: *Waste disposal, *Waste dumps, *Solid wastes, *Landfills, *Incineration, Economics, New York, Costs.
Identifiers: New York City.

A comparison of the market costs of different solid waste disposal alternatives is made. Through present value analysis, unit market disposal costs are derived for sanitary land fill by rail haul, land incineration, dumping of compacted bales at sea and sea incineration. The potential ecological problems of each system are considered. New York City is used as an example to provide a realistic picture of the potential and economic aspects of solid waste disposal at sea. (Ensign-PAI)

5F. Water Treatment and Quality Alteration

EXPERIMENTAL INVESTIGATION OF THE PRODUCTION OF BACTERIA IN WATER AND CONSUMPTION OF BACTERIA BY DAPHNIA, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Biologii Vnutrennikh Vod
V. I. Romanenko
Mikrobiologia, Vol 39, No 4, p 711-715, 1970. 4 tab, 7 ref

Descriptors: *Bacteria, *Daphnia, *Absorption, Biomass, Water purification, Analysis, Radioactivity techniques.
Identifiers: Antibiotics, Penicillin, Aureomycin.

Consumption of bacteria by daphnia in water basins was determined following suppression of bacterial multiplication by an addition of penicillin or aureomycin. Control cultures provided information on the increment of bacteria in the absence of daphnia. The palatability of antibiotic-treated bacteria was verified through introduction of carbon-14 labeled bacteria and measurement of radioactivity of daphnia. The results coincided with formulae of Romanov and Zonov and that of Huck. The method possesses a greater reliability than the filtration analyses. (Wilde-Wisconsin)

SALMONELLOSIS IN CATTLE,
Ministry of Agriculture, Fisheries and Food, Norwich (England). Veterinary Investigation Center.
E. A. Gibson.
Agriculture, Vol 73, 1966, p 213-216.

Descriptors: *Farm wastes, *Cattle, *Salmonella, Pathogenic bacteria, Infection, Bacteria, Carriers, Disinfection, Water treatment.
Identifiers: *Salmonella dublin, *Salmonella tyhimurium, Calves, Illness, England, Clinical signs, Vaccine, Prevention, Outbreaks.

The article describes the diagnosis, treatment, clinical signs, and prevention of salmonella in cattle. Though usually a disease causing calf losses it can affect adult cattle too. Under British conditions two main organisms are responsible. These are S. dublin which is essentially a pathogen of cattle, and S. typhimurium which seems able to infect all species of birds, animals, and man with equal facility. Recommendations are made for the disinfection and prevention of the disease. (White-Iowa State)

COLORIMETRIC METHODS FOR BROMINE,
Illinois State Water Survey, Champaign. Chemistry Section.
Frank W. Sollo, Thurston E. Larson, and Florence F. McGurk.
Environmental Science and Technology, Vol 5, No 3, p 240-246, March 1971. 7 p, 9 fig, 7 ref. U.S. Army Medical Research and Development Command. Contract DA-49-193-MD-2909.

Descriptors: *Water treatment, *Disinfection, *Colorimetry, *Water analysis, Chemical analysis, Color, Water chemistry.
Identifiers: *Bromine analysis, *Bromamines.

Reportedly bromamines are far more effective disinfectants than the chloramines and approach free bromine in disinfecting power. Study was undertaken to develop suitable colorimetric methods for determining free bromine and bromamines in water. Numerous reagents were screened on the basis of their reaction with HOCl, HOBr, NH2Cl, and NH2Br. Five reagents (methyl orange, DPD oxalate, phenol red, brom cresol purple, and phenosafranin) were selected for detailed investigation. Free bromine, free chlorine, bromamines, and chloramines may be distinguished from one another. Free bromine alone may be determined by the brom cresol purple or phenosafranin tests. PS is the less sensitive of the two tests. Phenol red is a unique test for total bromine. The DPD and MO tests may be used to determine plus free chlorine. The DPD test serves well to indicate total halogen, if potassium iodide is added to the sample. The MO test is also suitable for the determination of total halogen, in the presence of bromide ion. To form bromamines in a water supply by addition of chlorine and bromide ion, these would have to be added to a small volume of the water at low pH to form free bromine, and subsequently this solution would have to be mixed with the remainder of the water to be treated. (Knapp-USGS)

ACCOMMODATING UNCERTAIN FORECAST IN SELECTING PLANT DESIGN CAPACITY,
Gesellschaft fur Klaranlagen und Wasserversorgung, Mannheim (West Germany).
Paul M. Berthouex.
Journal of the American Water Works Associatio
Vol 63, No 1, p 14-20, January 1971. 7 p, 7 fig, tab, 38 ref.

Descriptors: *Optimization, *Water treatme *Design, *Forecasting, *Water demand, *Safe factors, *Statistical methods, Economics, Decisi making, Growth rates.
Identifiers: *Uncertainty.

The purpose of this paper was to outline metho for quantitatively considering factors which i fluence the design capacity selection for wa treatment plants. The six factors considered wer (1) the useful life of facilities; (2) the ease of e pansion; (3) the rate of growth of the service are (4) the rate of interest on the loan; (5) the chan in purchasing power during the debt period; a (6) the performance of the facilities during t early years. One other factor added was the lear ing curved effect, i.e. technological advances whi tend to offset the curse of inflation. The analy was expanded to show how safety factors, expect to provide an economic hedge against using unce tain forecasts of demand were derived. A bri review of forecast errors and the concept of econ my of scale in construction was given. Linear a exponential demand forecasts were considere The economic objective was simply to minimi long term costs, or to minimize expected long te costs when the forecast was treated as uncertai Simple demand growth situations were consider and two easily implemented optimization metho the Golden Section and the Hooke-Jeeves searc were suggested for finding optimal design capa ties. These two cases were said to give the plann upper and lower bounds on the demand capaci (Kriss-Cornell)

MODEL FOR FLOW AUGMENTATION ANALYSIS - AN OVERVIEW,
Florida Univ., Gainesville. Dept. of Environmental Engineering.
George R. Grantham, Edwin E. Pyatt, James P. Heaney, and Buford J. Carter, Jr.
ASCE Proceedings, Journal of the Sanitary Engineering Division, Vol 96, No SA5, p 1045-1055, October 1970. 11 p, 5 fig, 12 ref, append. FWQA Research Grant 16090 DRM, (formerly WP 1050).

Descriptors: *Low-flow augmentation, *Optimization, Water resources development, Systems analysis, Mathematical models, Linear programming, Regulation, Cost-benefit analysis, Waste dilution, Conjunctive use, Surface-groundwater relationships, Water pollution control.
Identifiers: Flow-augmentation benefits.

Beginning with the premise that the value of low flow augmentation is measured by sewage treatment cost avoided, a hydrologic flow simulator and a water quality linear programming model were interfaced to develop a procedure for determining a lower bound on the value of augmentation. This generalized approach can be applied by others to their specific water pollution control situations. The net benefit function may be determined with a comprehensive derivation of the flow augmentation cost function. This derivation includes not only direct costs, e.g., reservoir construction, but also imputed costs which reflect the value of water in alternative uses. These imputed costs may be important because of the relatively intensive demands for water which could be expected during low flow conditions. (Knapp-USGS)

AN ANALYSIS OF NEW JERSEY'S WATER POLLUTION CONTROL PROGRAM,
Rutgers-The State Univ., New Brunswick, N.J. Bureau of Government Research.
Philip H. Burch, Jr.
Available from NTIS as PB-197 884, $3.00 in paper copy, $0.95 in microfiche. Final technical report, New Jersey Water Resources Research Institute, New Brunswick, Part I (text), November 1970. 209 p. OWRR Project A-016-N.J. (1).

Descriptors: *State Government, Local Governments, Sewage Districts, Regions, Federal Government, Legal Aspects, Administrative Decisions, Planning, Standards, Monitoring, Regulation, *New Jersey, *Water pollution control, *Water quality control.

Prior to 1967 New Jersey's state water pollution control program was deficient in almost every significant respect. Up to the mid-1960's the state had not formulated any consistent set of water quality criteria to guide responsible authorities in the enforcement of an effective water pollution control program. The state health department's stream surveillance or monitoring program also left a great deal to be desired, for over the years there were not enough samples collected at various key points around the state to constitute a truly reliable indicator of water quality conditions. Furthermore, prior to the mid-1960's the state health department relied on what could best be described as variable effluent standards, specifications theoretically drawn up to meet each particular river valley or stream problem, but which were in fact of questionable validity and efficacy. And finally the actual enforcement record of the water pollution control arm of the state health department can only be characterized, up to the late 1960's, as one of extreme timidity or caution, particularly with reference to industrial waste discharge facilities. Fortunately, for the citizens of this highly urbanized and industralized state, there has been a substantial improvement in New Jersey's water pollution control program in recent years. Thanks largely to a rather drastic reorganization and shake-up of the state's water pollution control program--plus, as a result of pressure exerted by other agencies, the imposition of water quality criteria and effluent standards--New Jersey has now established a much more effective program in all major substantive areas other than water quality monitoring.
W71-05380

INSTITUTIONAL DESIGN FOR WATER QUALITY MANAGEMENT: A CASE STUDY OF THE WISCONSIN RIVER BASIN, VOL. 8, SECTION J - THE ECONOMIC AND FISCAL ASPECTS OF A REGIONAL WATER QUALITY MANAGEMENT SYSTEM,
Wisconsin Univ., Madison. Water Resources Center.
Anthony H. J. Dorcey.
Available from NTIS as PB-197 887, $3.00 in paper copy, $0.95 in microfiche. Report OWRR C-1228, 1970. 99 p, 13 fig, 13 tab. OWRR C-1228 (1601) (7).

Descriptors: *Water quality control, *Abatement, *Economics, *Cost sharing, *Wisconsin, Standards, Non-structural alternatives, Economic efficiency, Economics of scale, Value engineering, Cost-benefit analysis, Feasibility studies, Water policy, Project planning, Reservoirs.
Identifiers: *Wisconsin River Basin (Wis).

Criteria of economic efficiency, equity, and effectiveness are operationally defined and postulated as desirable in the design of policy to achieve regional water quality objectives. The Wisconsin River Basin is compared to the Ruhr Region and the Delaware Estuary in order to illustrate the uniqueness of effective and efficient policy design for any basin. The technological alternatives for influencing water quality in the Wisconsin River Basin and the nature of least-cost systems for achieving various quality objectives are described. The implementation of economically efficient systems through alternative policy arrangements are considered. The use of effluent charges as a policy mechanism on the Wisconsin River Basin are examined and it is concluded that they would be ineffective. An alternative policy arrangement which attempts to combine the advantages of regulation and economic incentive is suggested. This system-cost sharing arrangement attempts to effectively implement least-cost systems while meeting postulated criteria of equity concerning the distribution of costs and benefits of impounded water quality. PORK PRODUCERS AND POLLUTION: LEGAL ASPECTS,
Missouri Univ., Columbia. Dept. of Agricultural Economics.
Donald P. Levi.
Paper delivered at the Annual Meeting of Missouri Pork Producers Association, January 16, 1970, Columbia, Missouri. Agricultural Economics Paper No. 1970-6. 15 p.

Descriptors: *Legal aspects, *Regulation, Farm wastes, Disposal, Missouri, Maintenance, Waste water treatment, Water pollution control.
Identifiers: *Pollution laws, *Lawsuits, Nuisance law, Liability, Stockmen, Law.

Pollution of water and air by feeding operations is becoming a very real problem. Whether this constitutes a nuisance is a question of fact and depends on the circumstances of each case. The relative interests of the parties involved will determine

whether or not a given operation is closed down. Even if one is legally allowed to continue in business, the assessment of actual or punitive damages may make it unprofitable to do so. There is no one thing which farmers can do to guarantee that they be free from nuisance actions. Site selection, proper maintenance, zoning and licensing may help in some cases. (Christenbury-Iowa State)

Identifiers: *Animal production, *Population equivalents, Fiber content, Manure production, Nuisance potential, Feedlots, Oxidation ditch, Slatted floors.

A state of the art summary is presented on the control and management of animal wastes. Items discussed include the magnitude of the problem, pollution that has been caused by animal wastes, feasible treatment processes, major problem areas, and areas for future activity. Animal production and their subsequent waste production, properties, and characteristics are discussed first. The pollution and nuisance potential is then pointed out with respect to population equivalents. Waste treatment and disposal processes and systems follow. A summary and conclusion point out problems and what direction should be taken in the future. The paper was 86 references. (White-Iowa State)

DIGITAL SIMULATION MODEL OF INORGANIC WATER QUALITY OF TAHOE-TRUCKEE SYSTEM, NEVADA-CALIFORNIA, PROGRESS REPORT,
Nevada Univ., Reno. Center for Water Resources Research.
John V. A. Sharp, Richard L. Bateman, and Jerome A. Westphal.
University of Nevada, Desert Research Institute, Technical Report Series H-W, Hydrology and Water Resources Publication No 6, April 1, 1970. 21 p, 6 fig. FWPCA Program 16080 DPC.

Descriptors: *Model studies, *Digital computers, *Mathematical models, *Water quality, *Dissolved solids, Testing, Water management (Applied), Rivers, Waste disposal, Reservoirs, Water pollution, Planning, Water analysis, Flow, Flow measurement, Water quality control, Inorganic compounds, Hydrologic data, Stochastic processes, Analytical techniques, Equations, Nevada, California, Watersheds (Basins), Data collections, Input-output analysis, Parametric hydrology, Networks, Sampling, Environmental effects.
Identifiers: *Tahoe-Truckee River System.

This is a progress report on research to develop a digital model to simulate inorganic water quality in a complex system. For purposes of developing the model, the Tahoe-Truckee River System was studied. Regular and special analysis contributing to development and testing of the model are preliminary analyses of geology, geomorphic features, soils, and groundwater, daily stream flow records from many stations; monthly flow records; and reservoir storage and release records. The digital model, now approaching final stages of refinement, contains a hydrologic model providing monthly flows, a set of predictive equations, and a set of equations for simulating regulation. The purpose of the model is to describe and predict variation of water quality in terms of total dissolved solids so that accurate management decisions in areas of water quality control, waste disposal and pollution control can be made. By use of the model at its present state of refinement, the observed amounts of total dissolved solids is reasonably near the simulated amounts, and further development of the model is expected to produce more accurate simulation. Many parts of the model are given as formulae. (Yensen-Arizona)

ATMOSPHERIC GAS EXCHANGE IN THE MARINE ENVIRONMENT,
Newark Coll. of Engineering, N.J. Dept. of Civil Engineering.
Ivan Metzger, and Su LING Cheng.
North Eastern Regional Antipollution Conference, Annual, Proceedings, Kingston, Rhode Island, p 27-30, July 22-25, 1969.

Descriptors: *Atmospheric physics, *Gases, *Organic wastes, *Aeration, *Turbulent flow, Water pollution control.
Identifiers: Atmospheric gas exchange.

One aspect of the determination of the capacity of receiving waters to assimilate organic pollution is aeration. Predicting the exchange of low solubility gases with turbulent fluid has been researched. The exchange of such gases with the marine environment can be represented by equations. In these equations the energy dissipation must be evaluated for systems which have wind-induced turbulence. A procedure for this evaluation is given. (Ensign-PAI)

HARBOR DRIFT DISPOSAL,
Corps of Engineers, Washington, D.C.
Patrick A. DeScenza.
The Military Engineer, Vol 63, No 411, January-February 1971, p 31-33.

Descriptors: *Harbors, *New York, *Navigable waters, *Aquatic drift, *Solid wastes, *Waste disposal, Incineration, Water pollution control.
Identifiers: *Drifting debris, Derelict vessels, Shore structures, Dumping.

Each year 15,000 tons of drift and floating debris is removed from the navigable waters of New York Harbor. For many years, drift was disposed of by burning the debris on special floating barges anchored in upper New York Bay. This open burning process was improved from a pollution viewpoint by the addition of rows of water sprays which suppressed the fly ash and roughly scrubbed the gases of combustion. With the advent of stringent pollution controls and the increased emphasis on cleaner environment, other methods of disposal had to be investigated. Following the investigations, the land-based overfire air-pit-type incinerator was selected as the best method of disposal. The incinerator features and its operations are described. (Ensign-PAI)

Atomic Energy Research Establishment, Harwell (England).
H. J. Dunster.
Biological Implications Of The Nuclear Age, Symposium, Proceedings, Livermore, California, AEC Lawrence Radiation Laboratory, Bio-Medical Division, Oak Ridge, Tennessee, p 145-155, December 1969. 5 tab, 14 ref.

Descriptors: *Radioactive wastes, *Waste disposal, *Coasts, Water pollution control, *Monitoring, Liquid wastes.
Identifiers: United Kingdom.

The current policy for the disposal of radioactive wastes in the United Kingdom is summarized. The development of discharge criteria, the current basis of control and the results of the monitoring program are discussed. A high standard of safety is achieved by the various government departments so that there is no damage to the marine environment and no limitation on man's use of that environment. Control of the discharges of liquid waste from the fuel-reprocessing plant at Windscale into the Irish Sea is used as an example of their policy in practice. (Ensign-PAI)

STREAM QUALITY MODELING BY QUASILINEARIZATION,
Kansas State Univ., Manhattan. Dept. of Industrial Engineering.
E. Stanley Lee, and Irving Hwang.
Journal Water Pollution Control Federation, Vol 43, No 2, p 306-317, February 1971. 12 p, 2 fig, 8 tab, 6 ref.

Descriptors: *Water quality control, *Stream improvement, *Estimating equations, *Mathematical models, Biochemical oxygen demand, Dissolved oxygen, Boundary processes, Data collections, Least squares method.
Identifiers: *Quasilinearization technique, Parameters.

An introduction to a fairly effective technique for estimating parameters or coefficients in differential equations arising in stream quality modeling was proposed. The parameter estimation problem was treated as a two-point or multipoint boundary-value problem by the quasilinearization technique. To illustrate the approach, a simple representation of stream quality proposed by Camp and Dobbins which considered BOD concentration and DO deficit was shown. First, only three data points were available for estimating the rate constants. Then it was desirable to obtain a fairly large amount of data instead of just three data points. A classical least squares criterion was used where parameters were determined so that the sum of the squares of the deviations was minimized. Since the equations used were nonlinear systems with multipoint boundary conditions and could not be solved analytically, the quasilinearization technique, or the generalized Newton-Paphson method, was used and the computational procedure was given in detail. Numerical results included estimation of two parameters, estimation was experimental errors, and estimation of three parameters. A more general estimation problem which used five unknown parameters was also solved by the linearization operation. (Kriss-Cornell)

MODELING AND OPTIMIZATION OF WATER QUALITY IN STREAMS,
Kansas State Univ., Manhattan. Dept. of Chemical Engineering.

Rekha S. Rege.
Master's Thesis, Kansas State Univ, 1970. 123 p, 22 fig, 9 tab, 101 ref, 4 append. OWRR Project B-015-KAN (1).

Descriptors: *Optimization, *Mathematical models, *Water quality control, *Cost-benefit analysis, *Stream improvement, Dispersion, Biochemical oxygen demand, Dissolved oxygen, Water treatment, Constrants, Continuity equation.

A steady state on dimensional dispersion model was developed to represent the BOD and DO balances in a stream having several outfalls of waste and intakes of water. The model also included continuous additions and removals of BOD and DO along the stream. In the presentation, a literature survey was made dealing with the development of deterministic models for describing water quality in streams and water quality management models using a deterministic approach. Then a complete description of the formulation of the dispersion model was given. For the purpose of analysis the stream was divided into several segments, each segment beginning at the location of a waste outfall or water intake. The solution was derived by applying continuity equations at the boundary of each segment, and equilibrium conditions at the ends of the stream which were assumed to be infinitely long. The model was extended to incorporate waste treatment plant models at the location of waste outfalls, and water treatment plant models at the intakes. The optimal waste discharge policy along a stream was investigated based on a program of minimizing the total cost benefit function. The feasibility of obtaining a solution by a search technique capable of handling nonlinear constraints on water quality was studied. Application to a hypothetical stream and model use in future research were discussed. (Kriss-Cornell)

H. Fish.
Proceedings of Symposium: Farm Wastes: The Institute of Water Pollution Control and The University of Newcastle upon Tyne, Paper No 6, p 38-43, 1970.

Descriptors: *Farm wastes, *Legal aspects, Biochemical oxygen demand, Water pollution sources, Water quality control, Runoff, River regulation, Riparian waters, Groundwater, Legislation, *Disposal.
Identifiers: *United Kingdom, River authority, Common Law.

This article is concerned with the legal aspects of pollution and how they apply to agriculture. The ways in which farm waste can pollute water supplies and means of limiting the pollution effects are discussed. Large units located in close proximity to urban areas present the most difficult problems. Through cooperation between farmers and the river authority, the pollution effects of farm waste can be held at a minimum. (See also W71-05747). (Christenbury-Iowa State)

ULATION OF THE HYDROLOGIC CYCLE SMALL AGRICULTURAL WATERSHEDS DIGITAL TECHNIQUES,
inia Polytechnic Inst., Blacksburg. Dept. of cultural Engineering.
. Shanholtz, and J. H. Lillard.
/irginia Polytechnic Institute and State Univer- Water Resources Research Center Bulletin 40, -41, December 1970. 23 p, 16 fig, 5 ref.

criptors: *Model studies, *Mathematical els, *Simulation analysis, Digital computers, ems analysis, Synthetic hydrology. tifiers: *Stanford Watershed Model.

tal simulation models express the physical em of a watershed as a collection of mathemati- expressions. Probably the most comprehensive hese is the Stanford Model. It consists of a p of mathematical expressions which establish tionships between the elements of the rologic cycle and the interactions between its ponents. The model is normally operated with wn input and output and the different model meters are optimized until an acceptable fit is eved. Two agricultural watersheds (Brush k and Crab Creek), having areas of approxi- ely 800 acres and located near Blacksburg, Vir- a, were selected for study because they con- ntly reacted quite differently to given rainfall eriences. Five years of recorded data were used calibrate the model to each watershed after h five additional years of streamflow records e generated using the respective model parame- developed for the first period. For the most , the model appears to simulate the hydrologic process of a watershed within the accuracy of basic input data. The model can provide approximations for the practicing engineer that would be difficult to obtain otherwise. (See also W71-05555) (K-napp-USGS)

WATER RESOURCES PLANNING AND HYDROLOGIC RISK,
Cornell Univ., Ithaca, N.Y. Dept. of Water Resources Engineering.
Daniel P. Loucks.
Proceedings of Columbia University Seminar on Pollution and Water Resources, Volume I, 1967-1968, Columbia University, New York, NY, 1971, p 27-39. 13 p, 7 fig, 4 tab.

Descriptors: *Stochastic processes, *Mathematical models, *Optimization, *Water resources development, *Hydrologic aspects, *Risks, Planning, Management, River basins, Linear programming.
Identifiers: Deterministic model.

Some deterministic and stochastic models that were structured for defining and selecting alternative policies for managing (designing and operating) river basin systems were presented. The stochastic models explicitly considered hydrologic risk. Their solutions were compared to solutions obtained from deterministic models to determine the influence of risk on water resources planning. Discrete probabilities were used to approximate the continuous probability distributions of streamflow, reservoir volumes, and other hydrologic events, and discrete intervals of time were used to describe the continuous variable time. The models developed were solely for the preliminary screening of alternatives. They were static models for suggesting what the resource management policies should be, given some estimate of future economic, social and technological conditions. A review of the probability theory that forms the core of many of the stochastic models was given. The problem of determining reservoir capacity, reservoir storage and draft targets, and the reservoir operating policy that maximizes the expected net benefits was used as a numerical example. The deterministic model was presented and then was structured as a stochastic linear programming design model. A third model, called the 'operating policy' model, was developed to complete the multiple-used water resource system. An optimal solution from the two-stage process was obtained. (Kriss-Cornell)

SENSITIVITY ANALYSIS: A NECESSITY IN WATER PLANNING,
Texas A and M Univ., College Station; Dept. of Industrial Engineering.
W. L. Meier, A. O. Weiss, C. D. Puentes, and Joe C. Moseley.
US Dept of the Interior, 1971. 15 p, 8 fig, 1 tab, 3 ref. Office of Water Resources Research Project B-059-TEX (1).

Descriptors: *Optimization, Simulation analysis, *Computer models, *Water resources development, *Planning, Variability, Cost, Inflow, Reservoir operation, Texas.
Identifiers: *Sensitivity analysis.

Sensitivity analysis was shown to be of significant utility to the planner through presentation of a computer simulation and optimization model which quantified possible variations in system response as a result of uncertainty in the physical and economic conditions of a water resource system. A portion of the Texas Water System was used for the analysis and consisted of 12 reservoirs, 8 river reaches, and 34 pump canals. The system collected excess water in East Texas and transported these waters along with imports from in-state and out-of-state sources to points of high demand in West Texas. A 36-year demand build-up and simulation period was used. A historic filled-in data set and 18 selected synthetic data sets comprised of monthly demand, net evaporation and reservoir inflows were developed using data at all available flow measurement sites and a data filled-in and stochastic data generation procedure. The basic analytical tool used, the SIM III program developed by the Texas Water Development Board and Water Resources Engineers, Inc., was a detailed network simulation/optimization program with a minimum cost objective function on a monthly basis. The model considered evaporation data, import availability, streamflow data, and cost. Reservoir starting contents and size and sequence of canals were used to show response changes in the system. (Kriss-Cornell)

OPTIMIZING THE LONG RANGE OPERATION OF THE CALIFORNIA AQUEDUCT BY INCREMENTAL DYNAMIC PROGRAMMING SIMULATION,
California Univ., Berkeley. Operations Research Center.
I. Haissman, J. L. Matucha, and R. W. Shephard.
Operations Research Center, College of Engineering, University of California, ORC 70-44, December 1970. 41 p, 5 fig, 7 tab. National Science Foundation Grant No GK-23153.

Descriptors: *Optimization, *Dynamic programming, *Simulation analysis, *Computer programs, *Aqueducts, California, Reservoirs, Pumping, Monthly, Constraints.
Identifiers: Water release, Trajectories.

An exploration of the possibility of using incremental methods in dynamic programming to compute pumping and release monthly schedules which minimize the cost of contracted firm power for the operation of the Aqueduct system of the State of California was described. For this purpose the state of the aqueduct at any time was defined by water levels in the five reservoirs of the system. Pumping on the aqueduct and releases of water from the reservoirs result from changes in these five state variables which were traced out by simulation of the system using engineering data on gravity flows in the aqueduct, discharges of pumps and outputs of power at the three generating plants, allowing for deliveries of water to users, and evaporation of water along the way. For each of 120 months, the operation of the system was defined by a five dimensional state variable vector, implying certain releases and pumping of water determined by simulation. A set of 120 such ordered five dimensional vectors defines a trajectory in a state-time space prescribing the operation of the aqueduct over a ten-year period. A computer program was assembled and run to show feasible trajectories which satisfy a variety of constraints for pump capacities, storage of water in reservoirs, generation capacities and surge limitations for the canals. SYSTEMS ENGINEERING IN WATER RESOURCES,
Environemtnal Dynamics, Inc., Los Angeles, Calif.
John A. Dracup.
In: Report on 5th Annual Water Resources Research Conference, Sponsored by the Office of Water Resources Research, Dept. of the Interior, Washington, DC, p 171-176, Feb 3-4, 1970. 4 ref.

Descriptors: *Systems analysis, Research and development, Water policy.
Identifiers: *Water resources planning, Comprehensive planning.

Systems engineering is the art and science of selecting from a large number of feasible alternatives that set of actions which will best accomplish the overall objectives of decision-makers. Model building, linear programming, dynamic programming, and simulation are discussed. Current techniques being used by water resources researchers include multilevel optimization using both linear and dynamic programming. Water resource systems engineering has involved application of certain techniques of optimization and operations research to actual or hypothetical systems. Research efforts are moving towards including the stochastic and dynamic aspects of problems in the analysis. Also, research efforts are moving towards tying together several different techniques such as a linear and dynamic programming or mathematical programming and simulation in a multilevel optimazation approach. Needed research seems to be in two areas: (1) taking a single complex water resource configuration and applying several techniques and approaches, and (2) tying together piecemeal approaches in a regional concept. This analysis could then be expanded to include maximizing the benefits from the transportation, education and health inputs to the region. (Wray-Chicago)

METHODOLOGY STUDY TO DEVELOP EVALUATION CRITERIA FOR WILD AND SCENIC RIVERS; REPORT OF EVALUATION OF MINERALS AND MINERAL POTENTIAL OF THE SALMON RIVER DRAINAGE BASIN IN IDAHO SUBPROJECT,
Idaho Univ., Moscow. Water Resources Research Inst.
C. N. Savage.
Available from NTIS as PB-197 885, $3.00 in paper copy, $0.95 in microfiche. University of Idaho Water Resources Research Institute, Scenic Rivers Study Unit, September 1970. 64 p, 8 tab, 15 fig, 28 ref. OWRR Proj B-014-IDA (5).

Descriptors: *Mineralogy, *Mining, *Idaho, *Wild River Act, *Wild rivers, *Evaluation, Mining industry, Metals, Geology, Economic prediction, Water resources, Rivers, Maps, Data collections, Watersheds (Basins), Natural resources.
Identifiers: *Salmon River (Idaho).

Important ores and minerals found in the upper Salmon River drainage basin of central Idaho are listed along with the mining history of each, and amounts of ore and approximate market values where known. A large, important table includes import-export data, consumption, and stockpile information for 29 minerals and ores. Another table evaluates effects of various modern mining methods upon the environment. Fifteen full-page maps of the state of Idaho pinpoint mineral locations and geological formations. A very significant amount of mineral resources lies within the drainage basin under study, and the value of these resources should be considered when drafting regulations governing the use of wild rivers areas. A METHODOLOGY STUDY TO DEVELOP EVALUATION CRITERIA FOR WILD AND SCENIC RIVERS,
Idaho Univ., Moscow. Water Resources Research Inst.
E. L. Michalson, and Larry Kirkland.
Idaho University Water Resources Research Institute Progress Report No 1, 1969. 33 p. OWRR Project B-014-IDA (7).

Descriptors: *Scenery, *Recreation, *Wild rivers, *Idaho, Aesthetics, Water use, Conservation, Wild River Act, Streams, Rivers.
Identifiers: *Scenic rivers, Salmon River (Idaho).

The Salmon River, Idaho and its basin has been selected to develop a model system to evaluate wild and scenic rivers. The study involves an inventory of the natural and human resources of the area, estimates of future demands for quantities of these resources, and identification, description, quantification, where possible, of benefits from scenic beauty, personal enrichment, and other esthetic experiences derived from a river. A series of economic models were attempted to evaluate and determine resource use patterns consistent with a Wild and Scenic Rivers System, to compare them with resource use patterns under varying levels of development. A field survey of recreation uses was made in all the major recreational areas of the Salmon River. (Knapp-USGS)

Drainage, Roads, Transportation, Fire safety, Po
lice, Water supplies, Public health, Sanitary en
gineering, Education, Structural properties, Hou
ing, Costs, Law, *Colden (New York), *Erie Cou
ty (New York), Land use zoning, Land use.

e report contains all the basic studies for a com-
hensive plan for the Town of Colden. The
cific topics covered are land use, physical fea-
es, neighborhood analysis, population, mu-
ipal facilities, educational facilities, circulation
transportation, economic base analysis, and
nicipal finance. For each of the aforementioned
dies a survey was made of existing conditions
/or facilities, where appropriate, projections for
future were made, and their implications for
nning were noted. The basic studies indicate
Colden's popularity as a winter sports area will
tinue. Because of topographic limitations, sub-
an expansion will not be as extensive in Colden
n other areas. However, some suburban expan-
from Buffalo will occur, and the Town through
ing and other land use controls, should insure
future residential developments is compatible
the present character of Colden. This volume
only provides a general frame of reference but
vides specific guidelines for the Comprehensive
ster Plan and for plan implementation.

**METHODOLOGY STUDY FOR EVALUA-
N OF WILD AND SCENIC RIVERS,**
o Univ., Moscow. Water Resources Research

halson, E.L., Project Leader. University of
o, Water Resources Research Institute, Scenic Rivers Study Unit, September 1970. 8 p, 1 fig. OWRR Project B-014-IDA (9).

Descriptors: *Wild River Act, *Wild rivers, *Water resources, *Planning, *Evaluation, *Model studies, Water utilization, Economics, Research and development, River regulation, Rivers, Idaho, Natural resources, Water types, Census, State governments, Federal government, Benefits.
Identifiers: *Salmon River (Idaho).

The goal of this study unit is to develop criteria which can be used to determine values of proposed wild rivers and study rivers. Natural and human resources will be developed to try to quantify aesthetic, scenic, and personal benefits derived from the rivers. Alternatives for resource use with economic and social benefits will be studied. The Salmon was selected as the test river for these studies. Categories of rivers such as non-system rivers, wild rivers, scenic rivers, and recreation rivers will be proposed and methods of evaluating and classifying rivers developed. Fourteen subprojects were adopted for study: forest and range resources, minerals, outdoor recreation, commercial fisheries, irrigation, water for municipal and industrial use, water quality control, hydroelectric power, flood control, navigation, transportation and access, anthropology, history and agriculture. Data from these subprojects will be used to develop economic models to aid in evaluating alternative uses of water resources in the river basin area. A list of participating agencies and personnel is given. (See also W71-05703 and W71-05704) (Yensen-Arizona)
W71-05702

A METHODOLOGY STUDY TO DEVELOP EVALUATION CRITERIA FOR WILD AND SCENIC RIVERS; REPORT OF FLOOD CONTROL SUBPROJECT,
Idaho University, Moscow. Water Resources Research Inst.
John J. Peebles.
Available from NTIS as PB-197 997, $3.00 in paper copy, $0.95 in microfiche. University of Idaho Water Resources Research Institute, Report, February 1970. 79 p, 12 tab, 33 fig. OWRR Project B-014-IDA (8).

Descriptors: *Flood control, *Idaho, *Wild rivers, *Wild River Act, *Evaluation, Floods, Dams, Water storage, Costs, Benefits, Flood protection, Historic flood, Temperature, Watersheds (Basins), Rivers, Flood damage, Water management (Applied), Surface runoff, Snowmelt, Precipitation (Atmospheric), Maps, Projects, Hydrologic data, Discharge (Water).
Identifiers: *Salmon River (Ida).

This report lists major tributaries to the Salmon River and gives monthly and annual records of temperature, precipitation and discharge of the Salmon at various points. Apparently, no floods have been caused by rain runoff alone, but most are caused by a combination of heavy snow melt and rain runoff. The history of flooding in the Salmon basin is recounted and an appendix of 18 maps illustrates areas probably inundated during the Salmon's worst flood, which occurred in 1894. Costs of past floods are estimated and populations of small communities within the Salmon basin are given. Potential flood control storage sites are discussed, along with costs and benefits. Flood control benefits to the Salmon basin itself would be mostly negligable because of the limited amount of flooding, sparse population and small industrial and agricultural use of the area. However, flood control of the Salmon would benefit the lower Columbia River region. Many graphs and tables document this report. (See also W71-05702) (Yensen-Arizona)
W71-05703

A METHODOLOGY STUDY TO DEVELOP EVALUATION CRITERIA FOR WILD AND SCENIC RIVERS; REPORT OF WATER FOR MUNICIPAL AND INDUSTRIAL USE SUBPROJECT,
Idaho University, Moscow. Water Resources Research Inst.
Fred J. Watts.
Available from NTIS as PB-197 998, $3.00 in paper copy, $0.95 in microfiche. University of Idaho Water Resources Research Institute, Report, September 1970. 37 p, 1 fig, 19 tab, 4 ref. OWRR Project B-014-IDA (2).

Descriptors: *Wild River Act, *Wild rivers, *Municipal water, *Irrigation water, *Industrial water, Water resources, Water utilization, Planning, Forecasting, Water demand, Water policy, Water management (Applied), Water consumption (Excludes consumptive use), Water conservation, Rivers, Idaho, Data collections, Withdrawal, Hydrologic data, Watersheds (Basins), Water requirements.
Identifiers: *Salmon River (Ida).

Designation of the Middle Fork of the Salmon River as an instant wild river raised the question of whether or not the river could be maintained in a scenic and free-flowing state without endangering present and future water needs of communities, industries, and agriculture in Idaho. This report determines present water needs for municipal, rural, and industrial use in the state. For this purpose, Idaho is divided into seven regions. Panhandle, Clearwater, Salmon, Southwest Idaho, Upper Snake No. 1, and Upper Snake No. 2. Many tables list water withdrawal needs for these regions. From these data, and illustrated in other tables, projections of industrial and non-industrial water use for future years are made. The author concludes that the Wild Rivers designation for the Middle Fork of the Salmon River will have no effect upon present and future use of water in the Salmon River hydrological area nor upon needs of the entire state. THE EXPANSION OF OUTDOOR RECREATION FACILITIES; TWO CASE STUDIES FINANCED UNDER THE LAND AND WATER CONSERVATION FUND ACT IN WASHINGTON STATE,
Washington Univ., Seattle.
Daniel Perry Beard.
M. A. Thesis, 1969. 94 p, 16 fig, 64 ref, 2 append.
OWRR Project B-019-WASH (4).

Descriptors: *Recreation, *Local government, *Federal government, *Planning, *Water resource development, Economic evaluation, Costs, Time, Prices, Lakes, Land, Water law, Pollution, Financing, Population.
Identifiers: *Land and Water Conservation Fund Act, *Portage Island, *Lake Washington Beach, *Phasing.

This thesis investigates the efforts of federal, state and local governments in attempting to expand the outdoor recreation facilities within Washington State. Two recreation projects undertaken by local agencies and funded under the Land and Water Conservation Fund Act are studied. The City of Renton's Lake Washington Beach project and the Portage Island project undertaken by Whatcom County were the largest acquisition and development projects undertaken by local agencies. The historical background of the project and the actual process used to fund the project are examined with particular attention paid to the problems encountered during implementation. Particular attention is focused on the success of local planning, justification of site selection and the time required to complete applications and receive state and federal funds. On the basis of comparisons between the two projects the author recommends: (1) the time required for awarding of funds must be minimized; (2) phasing must be discontinued; (3) the time an application is valid must be limited; (4) a status report for all applications submitted should be implemented; and (5) a regional clearinghouse should be created to give local governments a source from

which to obtain information concerning all federal assistance programs. (Murphy-Rutgers)

CRITERIA AND METHODS FOR STATE WATER RESOURCE PLANNING,
Wyoming Univ., Laramie. Dept. of Agricultural Economics.
Thomas L. Dobbs, Paananen Orman, and Paul A. Rechard.
Available from NTIS as PB-198 031, $3.00 in paper copy, $0.95 in microfiche. Wyoming Water Resources Research Institute, Water Resources Series No 22, Jan, 1971. 68 p, 3 tab, 71 ref. OWRR Project A-001-Wyo (35).

Descriptors: *Planning, *Cost-Benefit Theory, Indirect benefits, Discount rate, Simulation analysis, Water resources, Development, *Evaluation.

Criteria that might be used for evaluating alternatives in Wyoming water planning programs are discussed in this report. Theoretical aspects of planning criteria are presented and considerable attention is devoted to questions relating to efficiency criteria. Criteria relating to goals other than the efficiency goal are discussed to a limited extent, and conceptual aspects of multiple goal planning are treated briefly. Quantitative methods for analyzing water projects and plans on the basis of various criteria are discussed, with emphasis given to the simulation technique.

SOME PROBLEMS IN ESTABLISHING A NATIONAL WATER POLICY; STATEMENT PROPOSED FOR THE NATIONAL WATER COMMISSION, NOV. 5, 1970,
Washington Univ., St. Louis, Mo.
Charles L. Leven.
Institute for Urban and Regional Studies, Working Paper Ins 8, Washington University, St. Louis, Missouri, December 1970. 27 p, 1 chart.

Descriptors: *Water policy, *Planning, *Decision making, Resource development, Multiple purpose, Optimum development plans, Analytic techniques, *Cost-benefit analysis.
Identifiers: Environmental policy, Comprehensive planning.

In carrying out its water resource development policies, the federal government imposes three kinds of impacts on the nation and its regions: construction, services, and development. The construction impact deals with the impact of using resources to build water resource projects, both the service and development impacts refer to the impact on the economy of project facilities and the services coming from them. In discussing the economic considerations of the long-run development impact of national water policy, there are four specific areas examined. (1) Estimatimation of future 'needs'--present planning techniques are inadequate because of difficulty in establishing a unit value for benefits, setting interest rates, and estimating costs. (2) Benefit estimation for a single region--occassionally local decisions may not be consistent with national criteria or they fail to recognize interregional interaction. (3) Measuring economic benefits to the nation--problems of noncomparability of multiple effects are difficult to overcome. (4) Recommendations for establishing a National Water Policy--policy ought to be concerned with tapping the environment in order to meet preconceived needs of the population, and in restructuring the environment in ways which change the terms on which water and other services as well will be available in the future and how such availability will influence the total economic adjustment process. (Wray-Chicago)
W71-05773

WATER RESOURCES REGIONS AND SUBREGIONS FOR THE NATIONAL ASSESSMENT OF WATER AND RELATED LAND RESOURCES.
Water Resources Council, Washington, D.C.

July 1970. 187 p.

Descriptors: *Management, *Water policy, *Administration, Analytical techniques, *Regions, *Land use, *Land resources, Water utilization.
Identifiers: *National assessment, Subregion delineation.

The Water Resources Planning Act (P.L. 89-80) directs the Water Resources Council to study and assess the adequacy of water supplies necessary to meet the water requirements in each water resource region in the United States, and also to study the relation of regional or river basin plans and programs to the requirements of larger regions of the Nation. This first National Assessment of Water and Related Land Resources was issued in 1968. One of the initial tasks involved in preparing for the next assessment is the delineation of geographic areas suitable for analysis. Guidelines for subregion delineation include: (1) areas drained by a river system; (2) a geographic area with common water management problems; (3) metropolitan regions; and (4) county lines. To facilitate compilations of data each county is identified as to its location within Economic Areas, Land Resource Areas, and Standard Metropolitan Statistical Areas. Every county is listed in its appropriate region and area. Maps outlining each of these geographic areas, as well as the water resource regions, subregions , and subareas are included. (Wray-Chicago)

Descriptors: *Planning, Decision-making, Social aspects, Social change, Urbanization Population, Optimum development plans.
Identifiers: *Comprehensive planning, Regional development, Metropolitan areas, Environmental quality, Urban environment, Water resources planning.

What we see in the physical, social, and econom development of our society is essentially the res of a sequence of evolution of human societies, fro simple society in which most of the economic a tivity was devoted to subsistence livelihood a then evolved into a mercantile type of society in t Middle Ages. This mercantile society progressed accelerating rate from the middle of the eighteen century into the industrial age which produced entirely new dimension. Urban regions appear with the industrial age. In the twentieth centu the megapolis is developing. The problems society and the environment presented by t growth are now being studied and discussed; the is a danger of having a premature determination what to do about a complicated problem. Planni for the future should coordinate all of the proces that affect planning: water resources, location transportation facilities, and the types of tho facilities and where people live and work. Identifiers: *Urban environment, Metropolit areas, Social system.

In many American cities, the importance of t railroad has diminished and along with it the re estate development that was originally on the routes. Since the 1930's the highway has been predominant factor in access, which in turn fluence real estate development. The la developer is totally dependent on access routes f his activity because land that is not accessible h very little value. Generally, access has been pr vided largely by the public agencies which dicta the standards. The ability to absorb access co into private land development is limited, and t financing methods prohibit long range planning the developer. In larger development (sever thousand acres) the developer has been able to fluence access routes to some extent, but costs volved have not made it profitable. The gover ment and private developers are now becomi concerned about developing more economic hou ing. Because sprawling urban areas have not eas

sing problems, developers are now looking k into high density areas. They are also in- sted in high density buildings in recreation as instead of subdividing mountain land to pro- low-density lots for only a few people. (See W71-05776) (Wray-Chicago)

A FRAMEWORK FOR URBAN WATER RESOURCES RESEARCH,
American Society of Civil Engineering, Cambridge, Mass.
M. B. McPherson.
In: Report on the 5th Annual Water Resources Research Conference, Sponsored by the Office of Water Resources Research, Dept. of the Interior, Washington, DC, Feb 3-4, 1970, p 143-148. 1 fig. 8 ref.

Descriptors: *Water policy, Future planning, Urbanization, Municipal water.
Identifiers: *Metropolitan areas, Water supply systems, Comprehensive, Water resources planning.

The evolution of the United States from an argarian to an urban society has seemingly outpaced the capacity for adjustment of our prevailing institutions of government. The greatest task of local governments in the future will be in providing new services. To meet needs of water services in urban American, government and academic cooperation is urged in research, and centralized direction in operation. Recent studies of research needs on urban water resource have found a preponderance of critical needs at the interfaces, likages and interrelationships with all other urban system elements. Research needs focus on providing the bases for devising new policies, creating new programs and establishing new institutions. The broad objective of all research should be to clarify the interactions that take place through linkages of 5 major areas (cf.figU). The immediate objective of individual research would be reinforcement of knowledge on one of the major categories. In the past, water resource development has been essentially land-orientated; future planning must be people-orientated. Scientists must be consequence-conscious in water resource planning and attempt to make their technological data understandable to citizens who make judgements. (Wray-Chicago)

Available from NTIS as PB-197 877, $3.00 in paper copy, $0.95 in microfiche. Report National Water Commission NWC-EES-71-001, March 1971. NWC-EES-71-001. 114 p.

Descriptors: *Water demand, *Economic prediction, *Municipal water, *Industrial water, *Irrigation water, Technology, Political aspects, Water distribution (Applied), Distribution systems, Water pollution sources, Domestic use, Thermal powerplants, Oil industry, Sugar beets, Arizona, California, Texas.

This report summarizes the findings of 3 studies on water demands: (1) urban, (2) industrial, and (3) agricultural; it analyzes the effects of likely market trends, public policies, and technological change on water use and water pollution. The 3 studies concentrate on representative establishments, but frequently generalize results. (1) The urban study focuses on residential demands, and gives aggregate extrapolations from 1970 to 1990; trends in commercial demands are also discussed. Economically feasible ways to reduce losses from municipal water systems are analyzed thoroughly. (2) Three industries were analyzed in detail: thermal electric power, beet sugar refining, and petroleum refining. In each industry the withdrawal, consumption, and wasteload patterns of a representative plant are studied as functions of water price, water quality standards or effluent charges, input qualities, and output mix; aggregate projections are given. (3) The agricultural study characterizes typical farms in 3 major irrigation areas: the Lower Colorado Basin, Central Arizona, and the hard soils section of the Texas High Plains. The responses of water use patterns to water pricing, farm programs, and technology are traced.

EFFECT OF WATER RESOURCES ON ECONOMIC GROWTH IN THE TENNESSEE VALLEY REGION,
Tennessee Univ., Knoxville. Coll. of Business Administration.
Charles B. Garrison.
Available from NTIS as PB-197 886, $3.00 in paper copy, $0.95 in microfiche. Completion Report, January 1971. 49 p, 9 tab, 3 fig, append. OWRR Project A-015-TENN (1).

Descriptors: *Streamflow, Regression analysis, Population density, Spatial distribution, Groundwater, Cost-benefit analysis, Evaluation, Water quality.
Identifiers: Water resources investment, *Economic growth, *Water availability, Chi-square tests, Water-oriented manufacturing, Manufacturing employment, Recurrence interval, Nonparametric statistics.

This study is concerned with the microlocation effect of water availability on manufacturing activity within the 194 county Tennessee Valley Region. The objectives of the study are to determine whether a statistically significant relationship exists between water availability in the region and location of water-oriented manufacturing activity; to determine whether a critical or threshold level of water availability can be identified and to quantify the relationship between water availability and manufacturing activities. Measures of both water availability or streamflow, and water-intensive manufacturing employment are developed at the county and small region level. Streamflow or water availability is measured by the annual seven-day low flow with a recurrence interval of ten years. A positive relationship was found between water availability and employment in water-intensive activities. Chi-square tests of independence indicate concentration of at least 500 employees are related to water availability. The tests indicate also a 7-day, 10-year minimum streamflow of 400 cfs is the threshold level of water availability for employment concentration. Additional locational factors were examined to explain the geographic distribu-

tion of employment concentrations. Regression analysis indicated a positive relation between population density and water-intensive employment. An estimate of the change in water-intensive employment by region was derived for the period 1959-1968. (Siegenthaler-Rutgers)

AUSTRALIAN-AMERICAN INTERBASIN WATER TRANSFER,
Colorado Univ., Boulder. Dept. of Geography.
M. John Loeffler.
Annals, Association of American Geographers, Vol 60, No 3, p 493-516, September 1970. 14 fig, 4 tab, 14 ref.

Descriptors: *Inter-basin transfers, *Water resources development, *Hydroelectric power, *Arid lands, *Irrigation, Water users, Water utilization, Water policy (Allocation), Legal aspects, Social aspects, Economic feasibility, Political aspects, Federal government, Recreation demand, Human population, Water transfer, Water conservation, Colorado, Regional analysis, Colorado River.
Identifiers: *Australia.

The Australian interior and the American west are both arid, water-starved areas. The concept of interbasin water transfer is not new to either country, but the entry of federal government into water diversion is new to both. The Snowy Mountains Project of Australia, transferring water from the snowy to the Murray River and the Colorado-Big Thompson Project of the U.S., transferring water from the Colorado to the Big-Thompson River, are the first federally-built projects on either continent. As such, they are precedent-setting. There were arguments against both. Most of the Australian population lives near the ocean, giving rise to doubt about the wisdom of diverting water into the arid interior. The Colorado River, in turn, drains the most arid region of the U.S., and can little afford water loss through interbasin transfer. The 2 major reasons for the water diversions, hydroelectric power and irrigation, are thoroughly examined for both regions in terms of economic feasibility. Both factors are clouded by considerations not accounted for in the planning stages. There is some question of the importance of hydroelectric power production in the U.S. in terms of it's percentage of total power production. Also, the importance of irrigation projects for increasing farm production in an already saturated market is questionable. However, there are many benefits, such as increased recreational facilities. Both the merits and the obsolescence of these projects are discussed in detail. (Casey-Arizona)

A SPATIAL ALLOCATION MODEL FOR PROJECTED OUTDOOR RECREATION DEMAND: A CASE STUDY OF THE CENTRAL UPSTATE NEW YORK REGION,
New York State Coll. of Agriculture, Ithaca, N.Y. Dept. of Agricultural Economics.
Mahfouz E. Tadros, and Robert J. Kalter
SEARCH-Agriculture, Vol 1, No 5, Cornell University Agricultural Experiment Station, New York State College of Agriculture, Cornell University, Ithaca, New York, January 1971. 24 p, 30 tab, 2 maps, 21 ref

Descriptors: *Linear programming, *Spatial distribution, *Optimization, *Computer programs, *Recreation demand, Time, Cost, Distance, Population, Swimming, Boating, Fishing, Camping, New York.
Identifiers: *Allocation model.

An allocation model designed to spatially distribute projected market demand for specified outdoor recreation activities was presented. After reviewing literature on various approaches to the spatial allocation problem such as regression equations, gravity models, and linear systems analysis, a linear programming model that simultaneously handles projected demand by occasion type, capacities of potentially visited recreation zones, and time, distance, and cost considerations was formulated. For the basic spatial allocation model, constraints were specified together with two objective functions; one to minimize total travel time, distance traveled, or cost involve by all visitors from all population zones and the other to maximize the number of visitors traveling to more attractive sites. The model was empirically evaluated via an application to 22 counties in central upstate New York, divided into 83 origin or population zones and 230 destination zones. The region was assumed to be closed area and the model was solved through use of the Fortran IV computer program, for four recreational activities: swimming, boating, fishing, and camping. Projected 1985 market demand was used as demand input for model solution. The solution appeared to give a general feeling for the magnitudes involved in recreational demand distribution. SELECTION OF THE OPTIMUM METHOD FOR ESTIMATING THE DEMAND FOR NON-MARKET WATER RESOURCES WITH INCOMPLETE INFORMATION,
Washington Univ., Seattle.
Gardner Brown, Jr.
University of Washington, Seattle, Washington, August 18, 1968. 6 p. OWRR Project A-015-WASH (1).

Descriptors: *Washington, *Sport fishing, *Estimating equations, *Economics, *Elasticity of demand, Salmon, Demand, Recreation, Fisheries, Anadromous fish, Model studies.
Identifiers: *Non-market water resources.

The Washington state sport salmon fishery was used as the working data source in this study, since it represents a valuable non-market water resource with incomplete information available for programming. An analysis of the economic demand for this fishery was undertaken, and an estimated demand equation was formulated, from which is can be suggested that, successfully managed, the non-commercial salmon fishery will continue to grow rapidly. Compared with a similar Oregon study, the income elasticity of demand was much higher, probably because of its basis upon time-series data rather than cross-section data. The model provides qualitative prediction value where quantitative data is not available. (Yensen-Arizona)

ALLEN V WOOD (TITLE TO ACCRETIONS T SEASHORE).

256 Mass 343, 152 NE 617-621 (1926).

Descriptors: *Massachusetts, *Accretion (Le aspects), *Boundaries (Property), *Seashor Shores, Boundary disputes, Riparian land, Ripari waters, Land tenure, Roads, Beaches, Coa Legal aspects, Judicial decisions, Bays, Naviga waters, Oceans.

Plaintiff landowner sought to register title to acc tions to his beachfront property. Plaintiff's prop ty was bounded on the front by the high wa mark, on the back by a public street, and at one e by the intersection of the high water mark and street. Plaintiff contended that, due to accreti his land extended to the intersection of accreted land and a line extending beyond the e of the public street. Defendant landowners c tended that plaintiff owned only up to the inters tion of the street and the high water mark as it isted at the time of the conveyance. The Supre Judicial Court of Massachusetts noted that acc tions to the shore ordinarily belong to the upla owner and that the monument made by described intersection could move as the h water mark moved. However, the court held t plaintiff could not own beyond the end of the str since there was no intersection of high water m and street beyond that point and affirmed judgment partitioning the remainder of the n shoreline among the upland owners. Plaintiff city condemned waterfront property of fendant landowners along the eastern shore Staten Island. Plaintiff and defendants both pealed the awards set in lower courts. Plain claimed that the defendants did not hold fee tit but merely the right to erect and use docks un the original land grant from the state. The Cour Appeals of New York held fee title was the pro basis for assessing value. The land was gran under statutes allowing land commissioners to p vide such title to lands under navigable waters the grantees did not perform conditions subsequ as to constructing docks, it was up to the state, the city, to object. Defendants objected to a lo appellate couion of the awards to the amount t original predecessors-in-title paid for the land, p costs of improvements. The court of appeals firmed the reduction, however, noting that grants under which their predecessor purcha stated that the city could acquire the property the original cost plus the cost of improvemen The clause ran with the title. V MAYOR AND COUNCIL OF UGH OF EDGEWATER (MUNICIPAL JUCTION TO REQUIRE LICENSE TO E VESSELS ON NAVIGABLE RIVER).
866-874 (NJ 1935).

ptors: *New Jersey, *Cities, *Jurisdiction, lation, High water mark, Low water mark, an land, Riparian rights, Hudson River, ble rivers, Non-navigable waters, Boundary es, Boundaries (Property), Reservation doc- Docks, Piers, Accretion (Legal aspects), spects, Judicial decisions.

f riparian landowner brought certiorari defendant city to review defendant's ability ecute under an ordinance requiring a license e vessels in the Hudson River. Plaintiff con- that defendant's jurisdiction did not extend ls lying between high and low water mark. The Supreme Court of New Jersey noted that: (1) the boundary of a riparian owner on a non-navigable stream extends to the thread of the stream, but the boundary of a riparian owner on navigable waters extends only to high water mark; (2) lands below high water mark belong to the state; (3) the state's title is proprietary; (4) the state's dominion over navigable waters is subject to the Congressional power to regulate navigation; (5) under common law, a riparian owner could appropriate lands between high and low water mark for his own use; and (6) a riparian owner has the right of access to the shore. Determining that municipal jurisdiction extended to low water mark by virtue of defendant's appropriation of property below high water mark for its exclusive use, the court held that plaintiff was subject to prosecution for violation of the ordinance. FAULKS V BOROUGH OF ALLENHURST (INSTALLATION OF SEWAGE TREATMENT PLANT ON PUBLIC ROAD EASEMENT).
180 A 877-880 (NJ Ct Err and App 1935).

Descriptors: *New Jersey, *Sewage treatment, *Easements, *Roads, Cities, Chlorination, Septic tanks, Sewage disposal, Sewers, Condemnation, Eminent domain, Right-of-way, Compensation, Public health, Riparian land, Oceans, High water mark, Low water mark, Tides, Legal aspects, Judicial decisions.

Plaintiff riparian landowner brought ejectment against defendant city to force removal of a sewage tank and chlorination unit from her premises. Defendant had a public road easement along the edge of plaintiff's tract. At the end of the road, where it ran into the ocean, defendant built a sewage chamber and a chlorination house. Plaintiff contended that these structures surcharged defendant's easement. Defendant contended that the structures were between high and low water mark on accreted land which was state-owned and hence plaintiff had no interest in the site. The New Jersey Court of Errors and Appeals defined 'high water mark' as the line of medium high tide between the spring and neap tides. Reviewing the evidence, the court determined that the high water mark was between the structures and the ocean and held that they were hence situated on the public easement. Since defendant did not attempt to justify the installation as a lawful street use, the court held for plaintiff, noting that defendant might acquire the premises by condemnation and payment. IN RE LANDS ON UPPER NEW YORK BAY (TITLE TO SUBMERGED LANDS GRANTED CITY BY CHARTER).

215 App Div 204, 213 NYS 486-500 (Sup Ct 1926).

Descriptors: *New York, *Land tenure, *Beds under water, *Cities, Ownership of beds, Beds, Real property, Roads, State governments, High water mark, Bays, Navigable waters, Legal aspects, Judicial decisions, Local governments, Highways.

Plaintiff municipality sought to acquire title to submerged lands in front of its streets. Defendant transit company claimed title to the lands through a conveyance from the state. Plaintiff claimed the lands by virtue of its charter provision passing title in fee to all submerged lands to plaintiff. Defendant's patent was ordered prior to the charter's effect, but was not issued until after plaintiff's charter was effective. Defendant contended that the charter could not pass title to land which the state did not own. The Supreme Court of New York stated that where a highway terminates at high water mark of navigable waters, submerged lands adjacent to the street are subject to an easement essential to the highway. But determining that another charter provision precluded plaintiff from impairing defendant's right to receive its patent, the court held title in defendant. Since the street intersected the shore, defendant's land was subjected to a public easement. The court furthermore noted that plaintiff's title was unaffected by a subsequent street closing, but was determined at the charter's effective data. (Hart-Florida)

CRABBE V MIDDLETOWN HYDRAULIC CO (PRESCRIPTIVE RIGHT TO USE APPROPRIATED WATER).
116 Ohio St 26, 155 NE 554-555 (1927).

Descriptors: *Ohio, *Prior appropriation, *Prescriptive rights, *Bayous, State government, Navigation, Appropriation, Preference (Water rights), Beneficial use, Surplus water, Judicial decisions, Legal aspects, Water rights, Contracts.

Plaintiff state brought quo warranto against defendant hydraulic company. Defendant's predecessors had appropriated bayou water for use as a millrace. Defendant's predecessor conveyed to plaintiff the right to a joint use with him of the water thus appropriated. Under the conveyance, plaintiff received the right to take all water required for navigation, without damage to the reservations in the conveyance. The state never used more than 8000 cubic feet per minute while defendant used between 18,000 and 22,000 cubic feet per minute. Plaintiff sought to compel defendant to reduce its use. The Supreme Court of Ohio held that by use of an amount in excess of plaintiff's use for some 50 years, defendant had acquired a prescriptive right, as against plaintiff, to continue to use the same amount of water. Identifiers: *Chile, *Bolivia, *Atacama Desert, *OAS, *Declaration of Montevideo.

The Atacama Desert of northern Chile is one of the driest regions of the earth. The Rio Lauca arises east of the Atacama on the high, semiarid Altiplano, runs 75 km. through Chile and 150 km. through Bolicia, following a shallow gradient, and empties into the Lago de Coipasa, in Bolivia. In 1939, Chile announced plans to divert part of the waters and irrigate the Azapa Valley, in order to provide a stable food supply for the city of Arica. This led to a series of intermittent and increasingly bitter exchanges between the 2 countries, through 1964. In efforts to resolve the problem, 2 different joint commissions investigated the project and an appeal was made to the OAS in 1962. Bolivia views the scheme as a serious transgression of it's rights as a lower riparian state and as another incident in a long history of economic, political and military aggression by Chile. In further claims that the project, by tampering with her 'patrimony', will adversely affect the climate of the Lauca Basin and increase salinization of the Lago de Coipasa. The country has also tied the issue to its long quest for an outlet to the sea (salida al mar). Chile simply views the scheme as an internal development pro-

gram vital to her arid region and is willing to compensate the few Bolivians who will suffer, in order to improve food supplies for 100,000 people. Bolivia has been able to produce no evidence for the claimed damage. Diversion began in 1962. Both countries accept the Declaration of Montevideo, but differ in their interpretation of it's applicability. The author feels that this problem may be solved by regional cooperation, but a great difficulty in cases of this sort, is the lack of a coherent body of international law. (Casey-Arizona)

FLORIDA WATER-RIGHTS LAW,
J. C. Adkins, Jr.
In: Florida Real Estate Law and Procedure, Harrison Company, Atlanta, p 1629-1653, 1960. 25 p, 64 ref.

Descriptors: *Florida, *Water law, *Riparian rights, *Water rights, Legislation, Lakes, Ponds, Natural flow doctrine, Alteration of flow, Civil law, Competing uses, Domestic water, Natural use, Reasonable use, Relative rights, Stock water, Surface waters, Conjunctive use, Drainage, Repulsion (Legal aspects), Riddance (Legal aspects), Surface runoff, Judicial decisions, Non-navigable waters, Subsurface waters.

In this chapter from a treatise on Florida real estate law, the law of water rights in Florida is divided into six sections: (1) Florida water resources law; (2) reasonable use theory; (3) non-navigable lakes; (4) surface waters and watercourses; (5) subsurface or percolating waters; and (6) lakes and ponds. Both case law and legislation relating to water rights is examined. It is stated that the rights of riparian proprietors to use waters of a non-navigable lake in Florida are equal. However, this principle is qualified by a statement that any use must be lawful and not detrimental to rights of other riparian owners. In addition, it is noted that non-navigable lakes may be privately owned. Surface water is described as water derived from precipitation, or rising to the surface from springs. The two rules governing use of surface--the civil and common law rules--are examined. In the discussion of subsurface waters, the author observes that Florida has rejected the common law rule of unrestricted right to draw percolating water from private land. Law pertaining to lakes and ponds is briefly discussed. (See also W71-05487) (Hart-Florida)
W71-05486

FISH (OWNERSHIP; PRIVATE AND PUBLIC RIGHTS),
J. C. Adkins, Jr.
In: Florida Real Estate Law and Procedure, Harrison Company, Atlanta, p 1656-1658, 1960. 3 p, 6 ref.

Descriptors: *Fish, *Florida, *Reservation doctrine, *Public rights, State governments, Legal aspects, Water law, Riparian land, Land tenure, Real property, Access routes, Fishing, Navigation, Civil law.
Identifiers: *Trust doctrine.

This section from a treatise on Florida real estate law, after noting that under Spanish civil law fish were held in trust for the public, observes that the trust principle carried over when Florida was ceded to the United States. This trust doctrine is subject to the federal power over navigation and interstate commerce. It is also noted that the public's ownership of fish is subject to state regulation for the general welfare. Fish are legally classified as ferae naturae, hence their ownership is in the state, not as a proprietor, but in a sovereign capacity as trustee for the people. However, once fish are reduced to possession, they may be properly claimed by particular individuals. Although there is a right to fish in public waters, there is no right to approach public water through private property, or to fish from private property without the owner's consent. (Hart-Florida)

EXECUTIVE ORDER 11548 (DELEGATED FUNCTIONS OF THE PRESIDENT UNDER THE FEDERAL WATER POLLUTION CONTROL ACT).

Federal Register, Vol 35, p 11677-11679, July 1970. 3 p.

Descriptors: *Pollution abatement, *Administrative agencies, *Water pollution control, *Supervisory control (Power), Federal government, Administration, Regulations, Administrative decisions, Jurisdiction, Coordination, Decision making, Leadership, Pollutant identification, Water pollution sources, Ships, Water pollution treatment, Oil, Oily water, Oil wastes, Navigation, Navigable waters, Inter-agency cooperation, Coast Guard regulations, Legal aspects, Institutional constraints.
Identifiers: *Water Pollution Control Act, *Water Quality Improvement Act.

By virtue of the authority vested in him by the Federal Water Pollution Control Act, the President of the United States, in this executive order, delegates authority to various executive departments and agencies. The Secretary of the Interior is authorized to : (1) investigate the control of pesticide release; (2) determine, in consultation with the Secretary of Transportation, the quantities of oil discharge harmful to the public health; (3) identify dispersants and chemicals; (4) determine substantial threats from, the abatement remedies for, oil discharges; (5) carry out provisions preventing oil discharge from non-transportation-related onshore and offshore facilities; and (6) designate hazardous substances, other than oil, presenting dangers to the public health or welfare when discharged onto navigable waters or adjoining shorelines. The Secretary of Transportation is delegated authority to inspect oil-carrying vessels and under proper circumstances, to board such vessels and execute arrest and other warrants. Responsibility for the issuance of regulations governing financial responsibility for oil carrying vessels is vested in the Federal Maritime Commission. Authority for the preparation and publication of oil removal contingency plans is given to the Council on Environmental Quality. The Coast Guard is designated as the agency empowered to receive notices of oil discharge. (Earl-Florida)

INTERSTATE SANITATION COMMISSION--TRI-STATE COMPACT--WATER QUALITY STANDARDS.
NJ Session Law Service Ch 212 (1970).

Descriptors: *New Jersey, *Interstate compacts, *Interstate commissions, *Water quality control, Legislation, Water pollution control, Non-structural alternatives, Administration, Administrative agencies, Standards, Regulation, Coordination, Interstate, Political aspects, Classification, Water analysis, Water quality, Effluents, Administrative decisions, State governments, Legal aspects.

The Interstate Sanitation Commission, by virtue of this legislation, is empowered to develop and place in force water classification and effluent standards within the Commission's tri-state jurisdiction. Such standards are required to be based on present or intended uses of the water in question and accompanied by regulations governing the quality of the effluents and receiving waters. Classifications made pursuant to this legislation must meet the water and related land resource plans and pollution-control plans of the signatory states. Such classifications must also comply with the procedural requirements of federal law. (Earl-Florida)

TOWN OF PALM BEACH V CITY OF WEST PALM BEACH (CITY'S POWER TO CONDEMN OTHER CITY'S PROPERTY FOR SEWAGE DISPOSAL PURPOSES).
239 So2d 835-840 (4th DCA Fla 1970).

Descriptors: *Florida, *Eminent domain, *Sewers, *Cities, Sewage disposal, Sewage, Outlets, Pipes, Pipelines, Condemnation, Sewage treatment, Governments, Conveyance structures, Outlet works, Oceans, Public health, Water pollution, Public utilities, Treatment facilities, Gases, Legal aspects, Right-of-way.

Plaintiff city brought action to condemn defendant town's property for the construction of a pipeline and ocean outfall. The pipeline and outfall were to be a part of plaintiff's sewage disposal system. Plaintiff also sought land for a gas-removal vault to extract gas from the pipeline, thus preventing possible airlocks. Defendant's town objected and contended that the city had no authority to acquire property within another municipality by eminent domain, that land for the gas-removal vault could not be acquired without defendant's consent, and that the construction of the ocean outfall was against public policy. Denying the town's petition for certiorari, the Fourth District Court of Appeal of Florida noted that statutes clearly gave the city power to condemn property within another municipality for sewage transmission lines. Moreover, the gas vault was such an integral part of the transmission system as to be within plaintiff's eminent domain power. The court also held that even though ocean outfalls are subject to regulation by the state and must meet stringent public health requirements, they are not against public policy per se; they are thus within a city's eminent domain power. (Liptak-Florida)

FARR V LEACH (REMEDY FOR REFUSAL TO CONSTRUCT DIVERSION DITCH ORDERED BY COUNCIL).
134 A 594-595 (Vt 1926).

Descriptors: *Vermont, *Remedies, *Legislation, *Floods, Cities, Streams, Flood protection, Flood routing, Floodwater, Overland flow, Rain, Storm runoff, Water injury, Ditches, Bypasses, Diversion structures, Drainage engineering, Water conveyance, Compensation, Payment, Cost repayment, Adjudication procedure, Judicial decisions, Legal aspects, Administrative agencies.

Plaintiff lower landowner sued defendant upper landowner in tort. Plaintiff's meadow was frequently flooded by a brook flowing over defendant's higher land. Defendant refused to cooperate with plaintiff to divert the brook, so plaintiff petitioned the municipal council under a statute authorizing the council to order diversion and apportion the cost between upper and lower owners. Another statute provided that if a party so ordered did not accomplish diversion, another party of record might enter upon the land of the first to construct a ditch to divert the water and demand payment therefor. The council ordered the plaintiff and defendant to construct portions of a ditch to divert the water. Defendant refused to construct his portion, whereupon plaintiff brought this action in tort for damages caused by defendant's refusal. Noting that plaintiff's complaint did not allege that his portion had been constructed, the Supreme Court of Vermont held that the statute provided the exclusive remedy for defendant's refusal and that, therefore, a tort action would not lie. Plaintiff's only remedy was to bring an action for payment after constructing defendant's portion of the ditch. (Hart-Florida)

GORDON V PETTEY (DAMAGES AND INJUNCTION FOR LANDSLIDES CAUSED BY LANDFILL ON UPPER SLOPE).
291 Pa 258, 139 A 914-916 (1927).

Descriptors: *Pennsylvania, *Remedies, *Landfills, *Landslides, Debris avalanches, Retaining walls, Soils, Drains, Stratigraphy, Judicial decisions, Legal aspects, Rain water, Rainfall, Percolating water.

Plaintiff lower landowner brought action for damages caused by defendant upland owner's land-

fill and sought an injunction to compel defendant to remove the fill. Defendant filled in his land without providing retaining walls or drains, causing a landslide which damaged plaintiff's property. The trial court found that the fill caused the slide by its pressure upon the underlying strata. Defendant contended that the slide was caused by rain water which percolated through and undermined the soil. Since plaintiff had specifically advised defendant of the danger, the Supreme Court of Pennsylvania held defendant liable. However, since plaintiff had not shown that further slides were likely, the court determined that an injunction compelling defendant to remove the fill or provide drains and retaining walls was improper in light of the inordinate expense which would be entailed by defendant's compliance. THE CANADIAN ARCTIC WATERS POLLUTION PREVENTION ACT: NEW STRESSES ON THE LAW OF THE SEA,
Wisconsin Univ., Madison. School of Law.
Richard B. Bilder.
Michigan Law Review, Vol 69, No 1, November 1970. 54 p.

Descriptors: *Pollution abatement, *Arctic Ocean, *Law of the sea, Legislation, Jurisdiction, Boundaries, International law, Water pollution control.
Identifiers: *Canada, *The Canadian Arctic Waters Pollution Prevention Act, Shipping zones, Fishing zones.

The Canadian Arctic Waters Pollution Prevention Act was approved June 17, 1970. This act assures Canada's jurisdiction to regulate shipping zones to 100 nautical miles off her coasts and authorizes Canada to establish exclusive fishing zones adjacent to the coasts but beyond the new 12 mile territorial sea. The act also considers international law and policy regarding the legal regime of Arctic waters, contiguous zones, archipelagoes waters and passage in international straits. These waters and the coastal states are considered regarding pollution prevention, law-of-the-sea and international agreement. (Ensign-PAI)

GIBSON V HOFFMAN (DISPUTE OVER OWNERSHIP OF MARSH MEADOW).

310 Pa 51, 164 A 783-786 (1933).

Descriptors: *Pennsylvania, *Boundaries (Property), *Boundary disputes, *Land tenure, High water mark, Low water mark, Riparian land, Rivers, Banks, Dikes, Marshes, Real property, Legal aspects, Judicial decisions.

In an action in ejectment over riparian land, a deed conveying '5 acres of marsh meadow bounded by river' was construed by the Supreme Court of Pennsylvania to convey adjacent land between low and high water marks. A subsequent deed describing the boundary as the top of the river bank, which was an artificial bank, was also held to include land between high and low water marks. Possession of the uplands was sufficient possession of the adjacent flat lands. (Hart-Florida)

CONGRESS PASSES WATER QUALITY IMPROVEMENT ACT OF 1970.
In: Man's Control of the Environment, Congressional Quarterly, Washington, DC, p 28-31.

Descriptors: *Legislation, *Oil wastes, *Mine wastes, *Ships, *Sewage, *Water pollution control, Cleaning, Federal government, Grants.
Identifiers: *Liability, Great Lakes, Alaska.

The Water Quality Improvement Act of 1970 was passed by Congress and signed into law April 3. The action by the House and Senate of the bill (HR 4148) is traced from its inception to the final action. The Law declares as U.S. policy that there should be no oil discharged into navigable waters of the U.S. or adjoining shores. Petroleum companies are made liable for up to $14 million in oil spill cleanup costs. Control over hazardous polluting substances, sewage from vessels, mine water pollution, Great Lakes pollution are also covered by this law. Training grants and scholarships for antipollution programs are included. The Law also created an office of Environmental Quality to act as a staff for the President's Council on Environmental Quality. (Ensign-PAI)

RIM OF THE SEA BECOMING CROWDED AND DIRTY.
In: Man's Control of the Environment, Congressional Quarterly, Washington, DC, p 21-27.

Descriptors: *Federal government, *Legislation, *International law, *Political aspects, *Water pollution control, *Coasts, *Great Lakes, *International waters, *National seashores, *National lakeshores, Oil, Accidents, Construction, Dredging, Sewage.

Offshore oil spillls, building developments, dredging, sewage and industrial waste are problems to be faced by coasts around the world. The rim of the sea is a natural resource which can no longer be taken for granted as either a food source or for aesthetics and amusement. The major mishaps in oil transporting and drilling are traced along with other pollution causes. The politics of pollution, federal legislation, and international agreements are discussed. Ideas for development, preservation, pollution control and remedies to coastal problems are presented. (Ensign-PAI)

SCHALLER V TOWN OF FLORENCE (VA TION OF DEDICATION OF BEACH PUBLIC).

259 NW 529-535 (Minn 1935).

Descriptors: *Minnesota, *Lakes, *Meand *Boundaries (Property), Mississippi River, Rip an rights, High water mark, Low water m Shores, Lake shores, Beaches, Littoral, Recreat Boats, Ships, Judicial decisions, Legal aspects.

Plaintiff riparian landowner brought action aga defendant town to have a plat vacated and lands dedicated therein vested in plaintiff. disputed littoral land had been dedicated to public for use as a steamboat landing. However, land was abandoned for that purpose and was as a bathing beach. From a lower court finding the beach could be used by the public only f steamboat landing and holding that, since this was abandoned, the public no longer had righ the beach, defendant appealed. The Supr Court of Minnesota determined that the dedica intended to convey to the public all of the be the steamboat provision being only an additi burden upon the beach. Stating that a meander is not necessarily the shoreline, the court cluded that the dedication extended to the wa edge rather than the meander line. Since vaca of the dedication and plat would not be in the interests of the general public, the court de plaintiff's petition, reversing the lower court's d sion. (Hart-Florida)

V CITY OF JACKSON (CITY'S RESPON- LITY FOR CULVERTS).
o 295-296 (Miss 1934).

riptors: *Mississippi, *Culverts, *Obstruction w, *Flood damage, Floodwaters, Floods, control, Streamflow, Streams, Creeks, ing waters, Civil engineering, Legal aspects, ial decisions, Water law, Adjudication dure.

iff sought to recover damages caused by the d negligence of defendant city. The damages ed when water overflowed plaintiff's proper- ty. Plaintiff's premises bordered a natural watercourse which flowed under a city street. The city provided a double-barrel culvert for the watercourse under the street. In the trial, engineers testified that this culvert was adequate, but further stated that such double-barrel culverts were more likely to be obstructed than one culvert the size of the two. The jury was instructed that the city was only required to provide a sufficient outlet to handle the ordinary water of the stream and that the city was not liable for damages caused by the collection of debris unless placed there by the city. On appeal, the plaintiff contended that this instruction was error. The Supreme Court of Mississippi reversed. It was a question of fact as to whether the drainage was adequate. The city was not relieved of its duty to keep the culvert free of obstructions by the fact that such obstructions were not placed there by the city. (Robinson-Florida)

HUDSON V TOWN OF MORGANTON (REGULATIONS DEPRIVING OWNERS OF FULL USE OF WATERSHED LAND).
171 SE 329-330 (NC 1933).

Descriptors: *North Carolina, *Watersheds (Basins), *Eminent domain, *Compensation, Damages, Local governments, Cities, Governments, Small watersheds, Land use, Remedies, Watershed management, Legal aspects, Judicial decisions, Land, Real property, Condemnation, Easements, Farms, Land management, Management, Environmental sanitation.

Defendant town established a watershed and promulgated rules prohibiting trespass on watershed property and requiring owners of watershed lands to take certain steps to insure sanitary conditions. Plaintiff claimed that such regulations deprived her of the full use of her farm land without compensation. The Supreme Court of North Carolina affirmed a lower court judgment for defendant. Defendant acquired no easement on plaintiff's land, nor did it trespass thereon physically. Where defendant did not physically invade plaintiff's property, plaintiff's apprehension of prosecution for violating defendant's rules deprived her of no rights requiring compensation. Moreover, plaintiff admitted that defendant provided her with no instructions as to sanitation. Since such instructions were required by statute, plaintiff could not have been subjected to penalty for breaking the regulations. (Dye-Florida)
W71-05635

JONES V EUPER (STATE'S TITLE TO ISLANDS IN NAVIGABLE STREAMS).
182 Ark 969, 33 SW2d 378-379 (1930).

Descriptors: *Arkansas, *Prescriptive rights, *Navigable rivers, *Islands, Boundary disputes, State jurisdiction, Boundaries (Property), Accretion (Legal aspects), Streams, Stream erosion, Accelerated erosion, Riparian rights, Alteration of flow, Diversion, Legislation, State governments, Judicial decisions, Legal aspects, Land tenure, Navigable waters.

Plaintiff landowner sued defendant sand and gravel company for damages to an island in a navigable stream. Plaintiff contended that defendant's operations caused a change in the river's course, thereby damaging plaintiff's island. Defendant contended that plaintiff had failed to establish his title to the island, arguing that plaintiff had failed to follow the correct procedure in acquiring title to the island from the state. Affirming a trial court decision for defendant, the Supreme Court of Arkansas noted that plaintiff's only possible claim to the island was by adverse possession. A statute provided that all islands formed subsequent to the admission of the state into the Union were the property of the state, subject to sale in the manner provided by the statute. As plaintiff had failed to follow this procedure, he could not alternatively claim title to the island through adverse possession. Title to state-owned islands in navigable streams cannot be acquired by adverse possession. (Smiljanich-Florida)
W71-05638

KEITH V DRAINAGE DIST NO 7 (LANDOWNER'S ACCRUAL OF CAUSE OF ACTION FOR TAKING OF PROPERTY).
36 SW2d 59-64 (Ark 1931).

Descriptors: *Arkansas, *Drainage districts, *Eminent domain, *Compensation, Reservoirs, Reservoir sites, Condemnation, Drainage programs, River flow, Diversion, Riparian rights, Submergence, Flood control, Natural flow doctrine, Alteration of flow, Administration, Local governments, State governments, Judicial decisions, Legal aspects, Flooding.

Plaintiff landowner sued defendant drainage district for damages caused by defendant's taking of plaintiff's land. Defendant had diverted the waters of a river from their natural course and impounded the waters in a reservoir, damaging plaintiff's land by submerging fertile ground. Defendant contended that plaintiff's land was sold prior to the accrual of the cause of action. In reversing the trial court's judgment for defendant the Supreme Court of Arkansas noted that plaintiff's cause of action accrued upon the defendant's filing of plans for the drainage district, which indicated that plaintiff's lands would be submerged. Where there is any invastion of private property by lawful authority for a public use, and the property is damaged thereby, there is a taking of land requiring the public to compensate the landowner for the deprivation of the beneficial use of his property. For purposes of determining right to compensation, the taking of private property occurs when the landowner's petition is filed. A subsequent diverstiture of his title does not work a forfeiture of plaintiff's cause of action. (Smiljanich-Florida)

DENNIG V GRAHAM (INJUNCTION TO PREVENT FISHING IN PRIVATE STREAM AND SPRING).
59 SW2d 699-703 (Mo App 1933).

Descriptors: *Missouri, *Remedies, *Fishing, *Adjudication procedure, Recreation, Fish stocking, Fly fishing, Fish, Springs, Streams, Rivers, Legal aspects, Judicial decisions, Navigable waters, Nonnavigable waters, Ownership of beds.

Plaintiff riparian landowner sought to enjoin defendant sportsman from fishing in his stream. Plaintiff owned a large tract upon which was located a large spring. The spring water formed a non-navigable stream which flowed into a nearby river. The spring and stream were stocked with fish at plaintiff's expense. Defendant had repeatedly fished the stream in spite of plaintiff's request for him not to do so. Notwithstanding defendant's testimony that he did not intend to fish the stream in the future, the evidence was held sufficient to show that defendant intended to fish the stream, indicating a reasonable probability of injury to plaintiff. Defendant contended that plaintiff's right to have him prosecuted for trespass was an adequate remedy at law. This contention was rejected. Concluding that plaintiff was threatened with irreparable harm, the Spring Court of Appeals of Missouri granted the injunction. (Hart-Florida)

SUPERIOR COAL AND BUILDERS SUPPLY CO V BOARD OF EDUC (LIABILITY FOR ALTERATION OF NATURAL LAND DRAINAGE).
260 Ky 84, 83 SW2d 875-876 (Ct App Ky 1935).

Descriptors: *Kentucky, *Surface drainage, *Historic flood, *Excessive precipitation, Rainfall, Artificial watercourses, Alteration of flow, Natural streams, Watercourses (Legal), Drainage, Drainage water, Surface waters, Floods, Runoff,

Rainfall-runoff relationships, Rainfall intensity, Damages, Riparian rights, Natural flow doctrine, State governments, Legal aspects, Judicial decisions.
Identifiers: *Negligence, *Act of God.

Plaintiff company sued defendant state agency for damages to plaintiff's land. Plaintiff contended that defendant substituted an artificial drain for a natural watercourse which, in periods of heavy rainfall, was inadequate in size. Plaintiff contended that water subsequently accumulated on its land, flooding and destroying it. Defendant contended that there was no allegation of negligence in plaintiff's petition and that the rains referred to were of an extraordinary nature. In affirming the trial court dismissal of plaintiff's petition, the Court of Appeals of Kentucky noted that the term 'heavy rainfall' must be construed as extraordinary rainfall, for which defendant would not be liable in the absence of negligence. As plaintiff had not alleged negligence by the defendant, its petition was properly dismissed. A landowner is entitled to the natural drainage of his land. However, in absence of negligence in the installation or maintenance of a substitute drainage for a natural watercourse, liability is limited to the result of ordinary rains, not an Act of God. (Smiljanich-Florida)

POLITICAL GEOGRAPHY OF THE ISRAELI-SYRIAN BOUNDARY DISPUTE, 1949-1967,
State Univ. of New York, Buffalo.
J. S. Haupert.
Professional Geographer, Vol 21, No 3, p 163-171, May 1969. 4 fig, 15 ref.

Descriptors: *Boundary disputes, *Political aspects, *Arid lands, *Geographical regions, *Political constraints, Water resources development, History, Economic impact, Social impact, Maps, Water resources, Water control, Legal aspects, Water rights, Riparian rights, Boundaries (Property), Foreign countries.
Identifiers: *Israel, *Syria, *Middle East.

Boundary claims arising from extended hostilities between nations have been major factors in political disputes since World War II. The 18-year series of conflicts between Israel and Syria along their politically contrived borders have largely involve water ways and riparian rights. Three demilitarized zones were imposed over territory allocated to Israel by the UN partition plan and the armistice agreement: (1) northern, near Kibbutz Dan, through which the River Dan flows to the Jordan River, (2) central, west of the Jordan River near the B'not Yaakov bridge and (3) southern, located in part of the Yarmuk 'triangle' southeast of Lake Kinneret. Between 1951-53, Israel embarked upon 2 major water projects--drainage of the Hula swamps and diversion of the Jordan River. The Hula Valley alone counts for 60% of all of Israel's water resources. The Syrians objected to the Hula project because the drainage canal would traverse the demilitarized zone and infringe upon Arab cultivation rights, as would the river diversion project. Over the years both countries supported accelerating claims by their nationals on extension of cultivation in the zones. Work on a hydro-electric project near the B'not Yaakov bridge elicited objections because it endangered traditional Syrian right of access for livestock and irrigation. Water transfer from Lake Kinneret to the Negev Desert without Arab cooperation or negotiation over fishing and cultivation rights led to retaliatory raids into Israel and artillary shelling from the Golan Heights. All of this was part of a larger political and social struggle, which is described in detail. (Casey-Arizona)

INTEGRATION OF CONNECTICUT WATER RIGHTS LAWS AND POLLUTION CONTROL LAWS,
Connecticut Univ., Storrs.
Theodore Pocht, Robert L. Leonard, and Robert Reis.
Available from NTIS as PB-198 000, $3.00 in paper copy, $0.95 in microfiche. Completion Report, November 17, 1969. 18 p. OWRR Project A-012-CONN (4).

Descriptors: *Connecticut, *Water pollution control, *Water rights, *Water utilization, Legislation, Legal aspects, Judicial decisions, Industrial water, Industrial wastes, Municipal water, Municipal wastes, Riparian rights, Discharge (Water), Sewage, Environmental effects, Regulation, Costs, Benefits, Surface waters, Groundwater, Research and development, Recreation, Water pollution, Administrative agencies.

As a guide for integration of Connecticut water rights laws and pollution control laws, the research project described in these reports examines: (1) the adminstrative structure for regulation of water resources, (2) case law on water resources, (3) the economics of water utilization, (4) the effectiveness of riparian rights in protecting recreational uses and environmental values, and (5) the efficacy of present pollution control laws and practices. The project attempts to provide a detailed background of Connecticut water law, criteria for evaluating water law and institutions, and a guide for needed changes in statutory law and administrative structure. The ability of administrative agencies to deal with water pollution problems has been improved by the passage of the Connecticut Water Pollution Control Act of 1967. Case law has not treated many areas of water use, but has developed classifications of water and rendered decision on such matters as riparian rights, municipal water supply and pollution problems. At present there is no economic need for a redefinition of water rights. There is a need for more economic incentives in pollution control laws and stronger regulation to assure adequate streamflow and reduce waste discharges. (Duss-Florida)

KELLY V KANSAS CITY BLDG AND LOAN ASS'N (LIABILITY TO ADJOINING LANDOWNER FOR OVERFLOW OF SEPTIC TANK).

86 SW2d 975-978 (Ct App Mo 1935).

Descriptors: *Missouri, *Septic tanks, *Public health, *Damages, Judicial decisions, Legal aspects, Cesspools, Domestic wastes, Sewage bacteria, Gases, Mosquitoes, Human diseases, Environmental sanitation, Safety, Sanitary engineering, Social aspects, Organic wastes, Sewage, Sewage treatment, Waste disposal, Real property, Odor, Fouling, Air pollution, Adjudication procedure.

Plaintiff landowner sued defendant company for injuries caused by overflow onto plaintiff's property from defendant's septic tank. Plaintiff contended the defendant's septic tank was negligently allowed to drain onto plaintiff's property, emitting four gases and odors, and attracting flies and mosquitoes. Plaintiff contended that as a result she suffered permanent injury to her health. Defendant generally denied the allegations and contended that plaintiff's injuries were caused by her privy vault or cesspool which had not been cleaned properly and which allowed water to run on the ground. The Kansas City Court of Appeals affirmed a jury verdict and judgement for plaintiff stating that the questions of defendant's negligence and plaintiff's contributory negligence were for the jury. If overflow from a septic tank causes injury to an adjoining landowner, a factual determination of negligence by the trial court must be respected by an appellate court. (Smiljanich-Florida)

In: 'Access--Its Effect on Area Growth and E vironmental Quality,' Central Washington Sta College, Ellensburg, Washington, May 15, 1970, 36-46. OWRR Project A-999-WASH (3).

Descriptors: *Legal aspects, Environment, Ecol gy, Natural resources, Conservation.
Identifiers: *Environmental policy, Environment quality, Water resources planning.

Water is one of the greatest natural resources in t state of Washington. Litigation over access water in the state is common and almost alwa bitter. These cases have involved cities, sportsme conservationists, and Indians. One case cited is th over Lake Chelan: A dam built on the lake cause thirty foot change in water level at various times the year. The court ruled that the public had a rig to use water for recreation when at its high lev but not to trespass privately-owned land when e posed by low level of water (Wilbour vs. Gallagh 1969). In 1967 the state legislature provided t Water Resources agency with authority to establi minimum flows and levels on lakes for the purpo of protecting fish and wildlife interests, aesthe values and water quality. The state administrati is now in the process of developing comprehensi sewerage drainage abatement plans. Washingt also cooperates with the national policy of not lowing water to be degraded below existing quali A Department of Ecology has been formed to de with all related problems efficiently. CUTIVE ORDER 11523, ESTABLISHING NATIONAL INDUSTRIAL POLLUTION TROL COUNCIL.

Order No 11523, Federal Register, Vol 35, 1, p 5993-5994, April 1970. 2 p.

Descriptors: *Industries, *Water pollution control, *Administrative agencies, *Water quality control, Pollution abatement, Supervisory control (Power), Federal government, Administration, Regulation, Administrative decisions, Jurisdiction, Decision making, Water pollution sources, Inter-agency cooperation, Legal aspects, Industrial production, Industrial wastes, Industrial plants, Environment, Environmental effects, Water pollution, Waste disposal, State governments, Local governments.
Identifiers: *National Environmental Policy Act.

In furtherance of the purpose and policy of the National Environmental Policy Act of 1969, the President of the United States in this executive order creates the National Industrial Pollution Control Council. The secretary of Commerce is given the responsibility of appointing the members of the Industrial Council, composed of representatives of business and industry. The Industrial Council shall advise on programs of industry relating to environmental quality. In particular its functions are to: (1) survey and evaluate industrial plans and actions in the field of environmental quality; (2) recommend solutions to the problems of the effects on the environment of industrial practices; (3) provide liason among members of the business and industrial community on environmental quality matters; (4) encourage business and industrial improvement in environmental quality; and (5) advise on environmental quality plans and actions of federal state and local agencies affecting industry. Provision is made for subordinate committees, administrative and staff service, compensation for members, and regulation of the Council's operation. (Smiljanich-Florida)

MARYLAND'S WETLANDS: THE LEGAL QUAGMIRE,
Stuart Marshall Salsbury.
Maryland Law Review, Vol 30, No 3, p 240-266, 1970. 27 p, 158 ref.

Descriptors: *Wetlands, *Maryland, *Coastal marshes, *Tidal marshes, Swamps, Salt marshes, Bogs, Standing waters, Surface waters, Bodies of water, Marshes, Aquatic environment, Aquatic habitats, Governments, State governments, Legislation, Legal aspects, Regulation, Water law, Riparian rights, Dredging, Landfills.

Dealing with the legal problems of Maryland's wetlands, this article begins with a historical review of title to lands under navigable waters, followed by a historical discussion of common law and Maryland statutory riparian rights. Wetlands include such areas as swamps or marshes permanently, temporarily, or intermittently submerged or inundated. The terms accretion and reliction are also defined. A new Maryland wetlands statute provides a legal and geographical definition of the term 'wetlands'. The statute furthers a new state policy of preserving these wetlands. Wetlands are broken down into state and private wetlands. The statute provides more stringent requirements for dredging and filling on state wetlands than on private wetlands. This statute conforms more to the common law than did previous statutory law, in that the riparian owner is entitled to natural accretions only. This article further discusses the procedural requirements and penalties provided by this new statute. The legal considerations of the wetlands statute are detailed under the following headings: uncompensated taking of private property, repeal of former riparian rights sections, and the public trust doctrine. DANGER ZONE REGULATIONS (FORT MONROE, VIRGINIA).
Corps of Engineers, Washington, D.C.

Federal Register, Vol 35, No 80, p 6575, April 1970. 1 p.

Descriptors: *Rivers and Harbors Act, *Bays, Administration, *Regulation, Navigable waters, United States, Legislation, Administrative agencies, Decision making, Adoption of practices, Administrative decisions, Governments, Federal government, Legal aspects, Bodies of water.
Identifiers: *Forts, Administrative regulations.

Pursuant to the provisions of section 7 of the Rivers and Harbors Act of 1917, this regulation, promulgated by the Corps of Engineers, governs the danger zone in the Chesapeake Bay off Fort Monroe, Virginia. Passage of vessels through the area will not be prohibited at any time. Commercial fishermen will be allowed to fish within this area, but no loitering or anchoring for other purposes will be allowed. No firing will be allowed during periods of darkness or poor visibility. The Commander, Fort Monroe, Virginia, is responsible for providing an advance firing schedule to the Coast Guard, who will enforce this regulation. (Robinson-Florida)

EXECUTIVE ORDER 11528 (CHANGING THE JURISDICTION AND MEMBERSHIP OF THE NEW ENGLAND RIVER BASINS COMMISSION).

Exec Order No 11528, Federal Register, Vol 35, No 82, p 6695-6696, April 1970. 2 p.

Descriptors: *Water Resources Planning Act, *River basin commissions, *Jurisdiction, *Leadership, River basin development, Water resources development, Legislation, Water resources, Administration, Federal government, State governments, Legal aspects, Water utilization, Interstate commissions, Interstate compacts, Water supply, Water conservation, Water policy, Maine, New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, New York.
Identifiers: *Executive orders.

By virtue of the authority vested in him by the Water Resources Planning Act, the President herein changes the jurisdiction and membership of the New England River Basins Commission. The Commission's jurisdiction shall consist of all or specified portions of the following states or areas: Maine, New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, New York and Long Island Sound. The membership of the New England River Basins Commission shall consist of: (1) a chairman appointed by the President; (2) one member each from the Department of Agriculture, Department of the Army, Department of Commerce, Department of Health, Education and Welfare, Department of Housing and Urban Development, Department of the Interior, Department of Transportation, Atomic Energy Commission, and Federal Power Commission; (3) one member each from Maine, New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, and New York; and (4) one member from each interstate agency, created by interstate compact, whose jurisdiction extends to the waters of the specified areas. AUTHORIZATION OF APPROPRIATIONS FOR COMMERCIAL FISHERIES RESEARCH AND DEVELOPMENT.

16 USCA sec 779b (Supp 1969) amending 16 USCA sec 779b (1964).

Descriptors: *Research and development, *Government finance, *Commercial fishing, *Grants, Fish establishment, Federal government, State governments, Legislation, Fish, Fish management, Fish conservation, Fisheries, Fish harvest, Administration, Legal aspects, Water resources development, Government supports, Regulation, Financing, Administrative agencies.

For the fiscal year beginning July 1, 1969, and for three succeeding fiscal years, 5 million dollars per year is appropriated for the Secretary of the Interior to carry out the purposes of this chapter. Also, $650,000 per year for the same period is to be made available to the states in such amounts as the Secretary may deem appropriate for the purposes of this chapter. The Secretary shall give preference to those states in which there is a commercial fishery failure resulting from natural or undetermined causes. Such funds are not to be used as grants for chartering fishing vessels. There is also appropriated $100,000 per year which shall be available for the Secretary to give to the state, in such amounts as he deems necessary, to develop new commercial fisheries. (Robinson-Florida)

ABANDONED MINE DRAINAGE CONTROL ACT OF 1970 (LAND RECLAMATION FOR WATER POLLUTION CONTROL).
Md Code Ann art 66c, secs 674a thru 674h (Supp 1970).

Descriptors: *Maryland, *Mine drainage, *Water pollution control, *Land reclamation, Mining, Mine wastes, Coal mine wastes, Strip mine wastes, Mine water, Water pollution sources, Water pollution, Pollution abatement, Land use, Water resource development, Land development, Legislation, Taxes, State governments, Surface drainage, Conservation, Revegetation, Public health.

In order to restore polluted state waters to the quality necessary to support fish and wildlife, recreation, and other beneficial uses, the Secretary of the Maryland Department of Natural Resources is authorized to acquire and rehabilitate land occupied or degraded by abandoned mines. The Secretary may take whatever action is necessary to prevent, control, and abate water pollution from such land. The Board of Public Works is authorized to issue Mine Reclamation and Water Quality Restoration Loan certificates for five million dollars and to sell them at public sale to the highest bidder. The proceeds of such loans are to be used exclusively for acquisition, improvements, or rehabilitation of abandoned mine property or for pollution control or treatment facilities. If the proceeds are used to rehabilitate privately owned land, the owner must contribute an amount at least equal to the resulting increase in the value of his land. An annual property tax is imposed to meet the interest and principal payments on the loan fund. The Secretary may backfill, grade, revegetate or seal mines, and control erosion and drainage to implement the purposes of the Act. Land acquired and rehabilitated may then be sold, retained, or transferred to a subdivision of the state. All proceeds from such sales shall constitute an Abandoned Mine Drainage Capital Fund to be used for the same purposes as the loan fund. The Department of Natural Resources may cooperate or undertake joint projects with other state agencies and political subdivisions and may procure any available federal assistance. (Liptak-Florida)

A STUDY OF THE RIPARIAN AND PRIOR APPROPRIATION DOCTRINES OF WATER LAW,
Georgia Univ., Athens. School of Law.
E. Ben R. Lancaster, and Bryan M. Storey.
Institute of Law and Government, School of Law, University of Georgia, Oct 1955. 204 p, 282 ref, append.

Descriptors: *Georgia, *Riparian rights, *Prior appropriation, *Natural flow doctrine, Alteration of flow, Artificial use, Civil law, Competing uses, Diversion, Domestic uses, Legal aspects, Judicial decisions, Legislation, Natural use, Ownship of beds, Reasonable use, Relative rights, Riparian land, Riparian waters, Water pollution, State governments, Appropriation, Preferences (Water rights), Administrative agencies, Beneficial use.

The two basic doctrines of American law relating to the utlization of waters--the riparian and prior appropriation doctrines--are examined in this work. Chapter 1 treats Georgia's existing water laws, particularly the riparian doctrine as declared by Georgia statutes and judicial decisions. The various legal classes of waters and the applicable legislation are also noted. In addition the important Georgia cases are summarized and categorized as to facts and rationale. Chapter 11 is devoted to the doctrine of prior appropriation. In this chapter the history of the prior appropriation doctrine is traced, and the doctrine's important features are described. The constitutional problems confronting lawmakers in the enactment of water rights legislation are discussed in Chapter 111. Emphasis is placed upon constitutional problems in converting from a riparian rights system to a system of prior appropriation. The advantages and disadvantages of the two water law doctrines are analyzed in the summary and conclusion, along with some broad deductions drawn from the study. The primary advantage of the riparian doctrine is stated to be flexibility, permitting facile adjustment to changing circumstances; however, the same flexibility creates uncertainty as to the extent of the riparian right. ARKANSAS GAME AND FISH COMM'N V STORTHZ (OWNERSHIP OF FISH IN PRIVATE LAKES).

181 Ark 1089, 29 SW2d 294-297 (1930).

Descriptors: *Arkansas, *Fishing, *Fish, *Nonnavigable waters, Lakes, Ponds, Surface waters, Ownership of beds, Riparian rights, Beds under water, Legal aspects, Judicial decisions, Water law, State governments, Damages, Land tenure, Administrative agencies, Contracts.
Identifiers: *Ownership of lakes.

Plaintiff landowner sought the cancellation of contracts given by defendant, the Arkansas Game and Fish Commission, for the exclusive right to trap and seine fish in two lakes on land owned by the plaintiff. Plaintiff also sought a judgment for the value of the fish taken an a restraining order against further fishing. The lakes were not connected with any navigable stream. The trial court dismissed the complaint in part but awarded damages. Plaintiff appealed, alleging that the lakes were private lakes, and defendant contended that the state owned the fish. The Supreme Court of Arkansas affirmed the award of damages and reversed the trial decision dismissing part of the complaint. Where a lake or pond is entirely within the land of one owner and there is no means of passage by which the fish can migrate to the waters of other owners, the landowner possesses the fish and fishing rights. UNITED STATES V 687.30 ACRES OF LAND (RIGHT OF UNITED STATES TO CONDEMN LAND FOR RIVER IMPROVEMENT PROJECT).

319 F Supp 128-134 (D Neb 1970).

Descriptors: *Eminent domain, *United States, *Treaties, *Indian reservations, Federal government, Condemnation, Land, Land tenure, Administrative agencies, Administrative decisions, Nebraska, Missouri River, Multiple-purpose projects, Projects, Judicial decisions, Legal aspects, River basins, Water utilization, Irrigation, Navigation.

Plaintiff United States sought to condemn land i Nebraska belonging to defendant Indian tribe. Th project was part of a comprehensive plan adopte by Congress to achieve maximum utilization of th water resources within the Missouri River Basi The Secretary of the Army made the decision t condemn the land pursuant to authority delegate by Congress in an 1888 act. Defendant contende that it owned the land by virtue of a treaty with th United States and that, while Congress coul abrogate the treaty and condemn the land, it coul only do so by specific legislation. Defendant als contended that the taking constituted deprivatio of property without due process of law under th fifth amendment. The federal district court grante plaintiff's motion for summary judgment. Congre was not required to enact specific legislation t condemn land owned by Indians. The decision t condemn the land was a reasonable exercise o authority delegated by Congress to the Secretary Defendant's due process argument was witho merit. (Duss-Florida)

Identifiers: *Conflicts of law, Mooring.

Plaintiff landowner sought in the Mississippi courts to recover the rental value of property used and occupied by defendant railroads. Defendants for many years operated railroad transfer boats across the Mississippi River and moored them upon plaintiff's property on the Louisiana side. Defendant contended there was no liability to plaintiff as Louisiana law controlled. Under such law rivers are highways, are open to the public, and everyone has the right to moor vessels on river banks. Defendants also contended that even if there was liability, the three-year Louisiana limitation on recovery should apply rather than the six-year Mississippi limitation, thereby reducing recovery. The trial court found for plaintiff and instructed the jury to assess damages at the claimed monthly rate for six years. The Supreme Court of Mississippi affirmed in part and reversed in part, holding that Louisiana law applied as to ownership of banks and, although the use of banks on navigable rivers is public, the owner of banks is entitled to compensation for mooring. As to the remedy, the Mississippi recovery limitation applied since it was the forum where the action was brought. (Duss-Florida)

FLOYD COUNTY V FINCHER (RECOVERY OF DAMAGES FOR PERMANENT INJURY FROM NUISANCE).

150 SE 577-579 (Ga 1929).

Descriptors: *Georgia, *Adjudication procedure, *Damages, *Highway effects, Local governments, Flooding, Legal aspects, Judicial decisions, Highways, Drainage water, Remedies, Drainage, Surface drainage, Ditches, Drainage effects, Land, Crops, Surface waters, Real property.

Plaintiff sought damages and an injunction for injury to his property resulting from construction of a public road by defendant county. Plaintiff alleged that the road caused drainage water to flow across his land, destroying his crops and extinguishing the value of his land for rental purposes. Plaintiff did not allege a decrease in value to his land resulting from defendant's actions. Defendant contended that plaintiff posed no cause for equitable relief and alleged no proper measure of damages. The Supreme Court of Georgia reversed the decision of a lower court overruling defendant's demurrer. Plaintiff was not entitled to an injunction against a continuing nuisance because roadbuilding is an important public function requiring an abuse of discretion for equitable relief. Plaintiff was left to an action for damages for the taking of his property, amounting to the difference in value before and after defendant's actions. However, no measure of damages was alleged for permanent injury to plaintiff's land. Thus plaintiff stated no cause of action. (Dye-Florida)
W71-05829

BRACKETT V BELLOWS FALLS HYDROELECTRIC CORP (PERSONAL INJURIES DUE TO TRESPASS OF WATER FLOW).
175 A 822-823 (NH 1934).

Descriptors: *New Hampshire, *Damages, *Floods, *Water levels, Legal aspects, Judicial decisions, Adjudication procedure, Flow, Watercourses (Legal), Dams, Rivers, Ponds, Hydroelectric plants, Land tenure, Water level fluctuations.

Plaintiff farm owner sued defendant hydroelectric corporation for damages. Defendant had raised the level of its dam so that the level of water at plaintiff's farm was also raised. As a consequence, a pool formed on plaintiff's field. No permission to so overflow was ever granted defendant, nor had defendant ever acquired flowage rights. Muskrats invaded the pool and built nests. While plaintiff was operating a horse-drawn mowing machine, one of the horses stepped in a muskrat hole and plaintiff was injured. Defendant contended that it was not liable for damages which were not probable nor should have been anticipated by it. The jury at the trial returned a verdict for plaintiff, and the Supreme Court of New Hampshire affirmed. Whether the flowing of plaintiff's farm was the cause of plaintiff's injury was properly a question for the jury. (Duss-Florida)
W71-05830

STATE V GUTHRIE (VALIDITY OF STATE PATENT TO ISLAND IN NAVIGABLE RIVER).
156 SW2d 210-215 (Ark 1941).

Descriptors: *Arkansas, *Islands, *Land tenure, *State governments, Navigable rivers, Real property, Proprietary power, High water mark, Rents, Navigable waters, Legal aspects, Judicial decisions, Administrative decisions, Adjudication procedure, Coal mines, Mining, Taxes.
Identifiers: Patents (Land).

Plaintiff state sued to set aside a deed, to recover an island held by defendant landowner, and to obtain an accounting for coal mined on the island. Plaintiff contended that the state land Commissioner had no authority to sell the island unless it was suitable for agriculture and above the mean high water mark of the river. Defendant contended that the land was both suitable for agriculture and above the high water mark. Reversing a judgment sustaining defendant's demurrer, the Supreme Court of Arkansas noted that although the land commissioner is presumed to have properly performed his duty under the law, plaintiff's contentions should have been accepted as true on demurrer since that presumption is not conclusive. The court also noted that equity would not allow plaintiff to recover the property or the profits therefrom without offering and paying a refund of defendant's purchase price, past taxes paid, and the cost of improvements. (Liptak-Florida)
W71-05831

STATE V QUATTROPANI (VALIDITY OF NO-BOATING ORDER TO PROTECT MUNICIPAL WATER SUPPLY).

133 A 352-355 (Vt 1926).

Descriptors: *Vermont, *Municipal water, *Boating regulations, *Water supply, Water quality control, Lakes, Ponds, Great ponds, Reasonable use, Riparian rights, Cities, Administrative agencies, Administrative decisions, Public rights, Public health, Potable water, Water quality, Water pollution, Water pollution sources, Water pollution control, Legislation, Boating, Regulation, Legal aspects, Adjudication procedure.

Respondent riparian owner was convicted of violating an order of the state board of health prohibiting boating on a pond which was used as a municipal water supply. Respondent contended that the order was void for lack of notice and as a taking of his riparian rights without compensation. The court af-

firmed the conviction and held that the only notice required was that of legislative publication, the board's order having the same effect. The court also noted that the order protecting the purity of the water supply was a reasonable exercise of state's police power and constituted a regulation, not a taking, of respondent's riparian rights and privileges. (Liptak-Florida)
W71-05832

NIES V BULKLEY (LIABILITY FOR BARGE COLLISION WITH SUBMERGED PILE).
104 Conn 382, 132 A 873-875 (1926).

Descriptors: *Connecticut, *Navigable rivers, *Boats, *Timber piles, Navigable waters, Rivers, Bridges, Bridge construction, Ships, Navigation, Piles (Foundations), Damages, Accidents, Engineering, Engineering structures, Transportation, Legal aspects, Judicial decisions, Adjudication procedure.

Plaintiff barge owner brought action against defendant bridge and highway commission to recover for damage to his barge caused when it ran into a submerged pile in a navigable river. Plaintiff contended that defendant had driven several temporary piles at the spot 14 years earlier in connection with the construction of a bridge and that the pile by which his barge was damaged was left in the river bed when the others were removed. Defendant contended that all their piles were 6 to 12 feet above the water and had been removed by the contractor under the supervision of the War Department engineer. The Supreme Court of Errors noted that whether the river was navigable at that spot and whether the War Department engineer properly performed his duties were questions for the jury, and that the trial judge improperly directed a verdict for defendant. However, the court affirmed the judgment for defendant and held that there was no evidence from which the jury could have found that the pile was one of the cluster driven by defendant at the spot 14 years prior to the accident. (Liptak-Florida)
W71-05833

STATE V ERWIN (TITLE TO ERODED LAND ON BED OF LAKE).
173 La 507, 138 So 84-92 (1931).

Descriptors: *Louisiana, *Ownership of beds, *Erosion, *Lakes, Navigable waters, High water mark, Accretion (Legal aspects), Shores, Beds, Boundaries (Property), Boundary disputes, Channels, Tides, Currents (Water), Rivers, Streams, Banks, Land tenure, Saline water, Fresh water, Legal aspects, Judicial decisions, Beds under water.

Plaintiff state of Louisiana brought suit to determine ownership of land which had by erosion become part of a lake. Plaintiff argued that the laws of accretion and dereliction applied and that defendants lost title to the land eroded away by the waves of the lake. Defendants contended that their title was good to the meander line established when Louisiana was admitted to the Union. The Supreme Court of Louisiana affirmed a judgment for defendants. The laws of accretion and dereliction do not apply to lakes. The lake in question was not merely a section of a navigable river. Thus, the state did not acquire title to the eroded land. One judge dissented on the grounds that the laws of accretion and dereliction do apply to lakes. On rehearing the court rejected the argument that the lake was an arm of the sea, although the lake was affected by the tides and was occasionally salty. If the lake had been found to have been an arm of the sea, adjoining lands which became part of the lake bed by erosion would belong to the public. (Duss-Florida)
W71-05834

KATZENBACH V ARMSTRONG CORK CO (CONSTRUCTION OF STATUTORY GRANT OF FILL RIGHTS IN NAVIGABLE RIVER).
132 A 324-325 (NJ Ch 1926).

Descriptors: *New Jersey, *River beds, *Landfills, *Legislation, Navigable rivers, Navigable waters, Delaware River, Tidal waters, Ownership of beds, Riparian rights, Riparian land, Riparian waters, Boundaries (Property), Boundary disputes, Reclamation, Land forming, Land development, Usufructuary right, Land tenure, Public lands, State governments, Cities, Legal aspects, Water law, Judicial decisions.

Plaintiff state sued to restrain defendant corporation from reclaiming and improving certain riparian and submerged land on the Delaware River. Plaintiff contended that defendant had no title to the land and would have to lease or purchase the land from the state. Defendant claimed title and the right to fill under a statute granting defendant's predecessor the right to fill and occupy any land fronting or adjoining its upland. The Court of Chancery of New Jersey noted that the special act granting fill privileges to defendant's predecessor should be strictly construed and considered revoked as to any land not already reclaimed or otherwise improved by the date of enactment of a later general act prohibiting reclamation of submerged tidewater land without the state's permission. Therefore, the court decreed in favor of plaintiff as to land not already reclaimed or improved at the passage of the subsequent general act. (Liptak-Florida)

ECOLOGIC AND ENVIRONMENTAL CONSIDERATIONS IN WATER RESOURCES MANAGEMENT,
Office of Water Resources Research, Washington, D.C.
Daniel L. Leedy.
In: Report on 5th Annual Water Resources Research Conference, Sponsored by the Office of Water Resources Research, Dept. of the Interior, Washington, DC, Feb 3-4, 1970, p 23-26.

Descriptors: *Environmental, *Ecology, Water policy, Planning, Coordination, Resource development, Future planning.
Identifiers: *Environmental problems, *Environmental quality, Water supply systems.

One of the significant trends in water and related resources fields in recent years has been the increased public awareness of environmental pollution. There is a definite need for scientists and ecologists to combine talents and direct their thinking to improving the environment. Expanding population adds other serious problems meeting increased water and recreational demands. In the future, there is an urgent need for more applied ecological research. (Wray-Chicago)

A PROPOSED STREAMFLOW DATA PR GRAM FOR MISSOURI,
Geological Survey, Rolla, Mo.
John Skelton, and Anthony Homyk.
Geological Survey Open-file report, 1970. 44 p fig, 3 plate, 14 tab, 10 ref, append.

Descriptors: *Streamflow, *Hydrologic data, *P ject planning, *Missouri, Evaluation, Data col tions, Regression analysis, Water resour development, River basins, Watershed mana ment, Flow characteristics, Channel morpholo Precipitation (Atmospheric), Topography, Vege tion, Gaging stations, Stream gages, Drainage, properties.
Identifiers: *Streamflow data evaluation (Miss ri).

The streamflow data program in Missouri is ev ated in order to design a network that will most e ciently produce the types of information needed development of surface water resources in state. The evaluation study has defined a prog of streamflow data collection and analysis for c rent purposes, planning and design, monitorin long-term trends, and definition of the stream vironment. A regression analysis that used stre flow data from 225 continuous and partial-rec gaging stations located in Missouri and adjoi states showed that, for ungaged sites on m streams with drainage areas greater than 50 squ miles, the following characteristics can be e mated within prescribed accuracy limits b regression equation: (1) mean flows, stand deviations of the annual means, low-order flo and flood volumes in the Plains region, (2) s dard deviations of the annual means, high-or floods, and flood volumes in the Plateaus reg and (3) high-order floods and flood volumes in Lowlands. A recommendation is made that 18 c tinuous-record stations be discontinued and tha be established. This will result in more substan streamflow data plus significant economics in work operation. (Woodard-USGS)

AEA (International Atomic Energy Agency)
ent-concentration gage is described. The
ods of carrying out the field calibrations by
s of a conventional sampler, the DH-48, are
arized, and the calibration curve is shown.
naximum sediment concentrations encoun-
under natural conditions did not exceed
ppm, but sediment concentrations exceeding
0 ppm were artificially generated in the field.
ed testing for the effect of temperature
e on the gage response showed that tempera-
as highly significant. Marked response to sea
appeared sufficient to preclude use of
sotope methods in brackish waters. It is
mended that the inconsistencies of the IAEA
when measuring low sediment concentra-
be studied with the object of developing a
sensitive radioisotope sensing system. The
nergy X-radiation from the cadmium-109
represents the end result of considerable
ch into the problem of lack of sensitivity of
sotopes in low sediment concentrations. The
ne advantage of radioisotope sediment mea-
ent is the elimination of the time and labor
ems associated with the conventional sam-
methods, and this advantage justifies the ex-
directed towards the development of greater
ility and sensitivity in radioisotope sediment-
ntration gages. (Woodard-USGS)

STREAM DISCHARGE ESTIMATION,
Forest and Range Experiment Station, Rangiora (Newland).
F. A. Johnson.
Journal of Hydrology (New Zealand), Vol 9, No 1, p 22-28, 1970. 7 p, 4 fig, 1 tab, 4 ref.

Descriptors: *Stream gages, *Discharge measurement, *Tracers, Electrical conductance, *Mixing, Discharge (Water), Streamflow, Electrolytes.
Identifiers: *Stream discharge estimation.

An electrically measured tracer method that minimizes the amount of field and laboratory work when measuring the three discharges at the junction of a main stream and a tributary is described. A comparison between discharges calculated from actual measurements and estimated from an electrical conductivity analysis is made. The dilution gaging technique to measure discharges upstream and downstream from the junction of a main stream and its tributary usually involves two discharge measurements and one estimation. The amount of field and laboratory work involved can be considerably reduced by making only one discharge measurement and using three electrical conductivity measurements to estimate the remaining two discharges. The technique is based on the injection of sodium dichromate solution at a constant rate, and the measurement of the subsequent dilution. (Knapp-USGS)

A HEATED ALPINE PRECIPITATION GAUGE,
Forest and Range Experiment Station, Rangiora (New Zealand).
C. L. Batcheler.
Journal of Hydrology (New Zealand), Vol 9, No 1, p 36-42, 1970. 7 p, 4 fig, 4 ref.

Descriptors: *Precipitation gages, *Snowfall, *Rain gages, Gaging stations, Data collections, Meteorological data, Instrumentation, Equipment, Precipitation (Atmospheric), Runoff forecasting.
Identifiers: *New Zealand.

A gage for measuring total precipitation at an alpine station, where most winter precipitation is snow, is described. The heating system in the gage employs an electro-mechanical device to control ignition and damping of a kerosene burner. Precipitation totaling 131 in., of which 37% was snow, was estimated for 1965 at an altitude of 4,700 ft. The recorded catch appears to be reasonably reliable. (Knapp-USGS)

INFORMATION FOR DECISIONS IN ENVIRONMENTAL POLICY,
Library of Congress, Washington, D. C. Environmental Policy Div.
Richard A. Carpenter.
Science Vol 168, June 12, 1970, p 1316-1322. 1 tab, 3 ref.

Descriptors: *Environment, Political constraints, Ecology, Legislation, Federal government, *Decision-making.
Identifiers: *Environmental policy, Legislative Reference Service, Public policy.

The National Environment Policy Act of 1969 promises to be landmark legislation in stimulating ecological research. Rising public concern with better use of resources requires a historic and wrenching turn for both business and political processes. Three approaches to environmental quality and productivity are currently identifiable and important. The traditional approach is marketplace economics: determining costs of all aspects of a policy problem, in which a major difficulty is the quantification of long-term interests when economic theory discounts the future value of money. A second well-established viewpoint is that of human health. The powerful appeal of protecting health is useful in motivating social actions that are otherwise uneconomic. The third approach is that of ecology, for which it is difficult to quantify values. In order to legislate policy of protect and enhance the environment, the legislators must have technical information on which to base decisions. This information flows from all levels of society via diverse mechanisms, i.e., personal advisory groups, committee hearings, executive agencies, lobbies, etc. The Legislative Reference Service serves as a center for information; the Environmental Policy Division handles the information relating to environment. An important aspect in assisting Congress is to keep objective, technological questions separated from the political context. Ecologists, now gaining prominance in the environmental field, have a tremendous opportunity to influence policy through their participation in public affairs. (Wray-Chicago)

SURFACE WATER DATA - QUEBEC, WATER YEAR 1966.
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.

Translation of Annuaire Hydrologique - Quebec by Quebec Dept. of Natural Resources, Water Survey of Canada. Canada Dept of Energy, Mines and Resources, Inland Waters Branch Data Report: Information Canada, Ottawa, 1970. 339 p.

Descriptors: *Surface waters, *Hydrologic data, *Gaging stations, *Networks, *Data collections, Streamflow, Rivers, Lakes, Reservoirs, Dams, Powerplants, River basins, Discharge measurements, Water levels.
Identifiers: *Canada, Quebec, Hydrometric network.

To fulfill data needs for most of the Province of Quebec, this publication presents a compilation of available discharge and water level data for rivers and lakes for the 1966 water year. The hydrometric network, divided into three categories, consists of 351 stations, 41 of which were added in 1966. Of the 193 regular streamflow stations 6 were seasonal. There were 68 stations equipped with punched tape recorders, 91 with stylus-type recorders and 34 with manual gages. Of the 88 water level stations, 11 are crest gages, 22 are equipped with automatic recorders and 52 have a manual gage. There are 70 stations at dams, 42 at reservoirs and 28 at powerplants. This publication contains recorded water levels and computed discharges grouped by hydrographic regions. Eight small scale maps show the drainage patterns and location of streamflow and water level stations with numbers keyed to the data tables. Following the data tables is a numerical index that lists the stations which are shown in color on the maps. The index gives the number and name of the stations and page number on which the data are given. An alphabetical index to the report is given last. (Lang-USGS)

LOT II - COMPUTER PROGRAM FOR A PROCESSING AND GRAPHICAL DIS-Y FOR RADIOISOTOPIC SAND TRACER DY,
Coastal Engineering Research Center, ington, D.C.
A. Turner.
C Miscellaneous Paper 3-70, May 70. 66 p, 10

riptors: *Computer programs, *Oceanog-, Continental shelf.
ifiers: *Dynamic oceanography, ioisotopic sand tracer, Hydrographic survey.

LOT II is a computer program for processing tion and navigation data from field surveys of isotopic sand tracer (RIST) study, but is ap-ble to any survey type operation on the hore Continental Shelf. Collected data are hed onto paper tape by the data collection puter on the research vessel. The data are later ferred to magnetic tape which provides the for the RAPLOT II Program. Program con-arameters are on punched cards. The naviga-data, which consists of ranges to two shore-l radar beacons, are first edited for spurious and then converted to rectangular coor-es (in this case the California Lambert Coor-e System). Radiation data are converted to t rate as counts per second. Background count s computed and subtracted from the observed count rate, and any radiation counts that are significantly above the background count rate are corrected for time of decay since the isotope was injected. Output from the program is in three forms - printed output, graphical output, and magnetic tape record. The processed data are transferred to magnetic tape and made available for further processing, such as the generation of contour maps. (CERC)

EXPERIMENTAL DUNES OF THE TEXAS COAST,
Army Coastal Engineering Research Center, Washington, D.C.
Bard O. Gage.
CERC Miscellaneous Paper 1-70, Jan 70. 33 p.

Descriptors: *Shore protection, *Dunes, Texas.
Identifiers: Barrier Islands, Snow fences, Beach grass, Junk car bodies.

Storms and increased habitation on barrier islands have reduced the height and width of dunes on the Texas Coast, thereby exposing it to the surges and waves produced by tropical storms in the Gulf of Mexico. This publication reports on experimental means of creating and stabilizing sand dunes to protect the coast. Four locations were selected; the SW end of Galveston Island, Packery Channel, Newport Pass on North Padre Island and Corpus Christi Pass. Low areas of the barrier islands were planted in various types of vegetative cover in an attempt to establish dunes without the aid of sand fences. Snow fencing was used to accumulate windblown sand and vegetative planting made to stabilize dunes. Junk car bodies were placed in line parallel to beaches and used instead of more conventional means to establish and stabilize dunes by trapping sand. Since snow fences are more effective and much cheaper junk cars are not recommended for building dunes.

FOAM AGENTS AND FOAM DRILLING,
Jersey Production Research Co., Tulsa.
A. S. Murray, and J. E. Eckel.
Oil and Gas Journal February 20, 1961. Reprint, 4 p.

Descriptors: *Drilling fluids, Muds, *Drilling, Rotary drilling, Drilling equipment, Oil industry.
Identifiers: *Foam drilling, Air drilling, Mist drilling, Formation water, Foam injection, Cuttings.

Foam drilling is only one modification of air drilling, but its importance is growing. Successful foam drilling depends on an efficient foaming agent-one that has the properties needed to get the job done. This article deals with these requirements of a foaming agent, and other aspects of foam drilling. From experience, operators realize that air drilling in general has these advantages: (1) improved definition of stratigraphy and structure, (2) more and usually better well data, and (3) two to ten times the penetration rate and bit life. Dry formations are usually drilled with only air as a circulation medium. But when other conditions are present, the drilling fluid must be modified in these ways: (1) Foam drilling is used to penetrate competent water-bearing formations, (2) aeration drilling is used to penetrate less-competent formations that can be drilled with foam, and to lift large flows of formation water, and (3) chemicals are used to shut off flows from water-bearing formations. (Campbell-NWWA)

MUD KNOW-HOW HELPS EXPLORATION DRILLING,
National Lead Co., Houston, Tex., Baroid Div.
George R. Gray.
Mining in Canada, May and June, 1970. Reprint, 6 p.

Descriptors: *Drilling fluids, Muds, Drilling, Mining, Water wells, Rotary drilling, Core drilling.
Identifiers: *Drilling fluid function, Density, Flow properties, Gel development, Filtration properties, 'Bad ground', Wall-stuck rods, Lost circulation, Mud technology.

Modern drilling fluids technology is making substantial contributions to mineral exploration through reduction in time spent in coring, and improvement in core recovery. Both factors have become increasingly important in recent years because labor is a major item in the cost of exploratory drilling and increase in footage per shift is significant. The enormous capital investment needed to develop low-grade ores requires full information on the prospect; hence, the demand for complete core recovery. The mud should be used as a tool, not as a last resort when the situation otherwise appears hopeless. In the minds of many drillers 'mud' is associated only with 'trouble'. This attitude is not sensible. Mud should be employed as a device to avoid hole problems. Satisfactory performance of the drilling fluid depends on the conditions of use. The drill tools and the driller's skills, as well as the rocks drilled, significantly affect the success of the mud program. There is no more an all-purpose drilling fluid than there is an all-purpose diamond bit. Recognition of the limitations and capabilities of the personnel, the equipment, and the drilling fluid is essential to the effective planning of a coring program. (Campbell-NWWA)
W71-05686

ECONOMICS OF PERCUSSION VERSUS AIR ROTARY DRILLING,
Mission Mfg. Co., Houston, Tex.
Robert E. Bates, Jr.
World Oil, February 1, 1965. 9 p, 11 fig.

Descriptors: *Drilling, *Oil industry, Rotary drilling, Drilling equipment.
Identifiers: *Percussion rotary drilling, Air rotary drilling, Kinetic energy, Percussion bit life, Drilling rate.

Percussion drilling tools and technique are gaining acceptance and moving out of specialty application. The extremely rapid hammer blows - delivered with relatively light weight-on-bit-increase bit life, decrease drill collar wear and help control deviation while maintaining penetration rates. The technique is limited, however, to systems using circulating fluids which are compressible, such as air, natural gas and foam (mist). Percussion rotary drilling is the rotary technique in which the main source of energy for fracturing rock is obtained from a percussion machine connected

directly to the bit. The circulating system, drill string and hoisting system are unchanged from that used in the conventional air rotary method. Field performance results and cost-analysis nomographs determine when to consider using percussion drill. (Campbell-NWWA)

OIL FIELD TECHNIQUES USEFUL IN WATER WELL DRILLING,
Southern California Water Co., Santa Barbara.
Harvey A. Mylander.
Water Well Journal, Reprint from Nov-Dec 1955, Jan 1956, and March 1956, 11 p, 17 fig, 2 tab, 8 ref.

Descriptors: *Rotary drilling, *Logging (Recording), Electrical well logging, Radioactive well logging.
Identifiers: *Pilot bore, Magna-Tector, Jet casing cutter, Bottom hole jet cutter, Temperative surveys, Pressure surveys, Flow surveys, Projectile perforating, Pneumatic well seal, Typical well completion costs, *Single-Shot Photographic Drift Indicator, *Multiple-Shot-Photographic Drift and Directional Indicator.

This article summarizes briefly some of the more useful oil field techniques that are fully developed and readily available for water well use. Pilot holes are usually drilled, then reamed to final diameter, in one or more passes. After the well bore is completed the casing is lowered into place and the space between is often packed with gravel. Early in the development of rotary drilling, it was evident that holes started straight at the surface but did not continue to be vertical as the bit penetrated steeply dipping beds of different hardnesses. The instruments used to determine drift and direction may be classed as (1) single-shot or (2) multiple-shot. Other instruments, such as electrical and radioactive logging are also of considerable use. Caliper instruments which measure hole diameter find common use for (1) determining intervals of significant caving (2) calculating the quantity of gravel necessary to properly gravel-pack the hole behind casing and (3) picking sections suitable for locating centering devices for the casing within the well bore. The Magna-Tector is a down-hole tool for locating the point at which pipe is stuck in a well, or the lowest point that it is free. Jet casing cutter and a bottom hole jet cutter also finds some application in alleviating stuck drill pipes and bits. Pneumatic well seals and charged perforating devices aid in converting abandoned oil wells to water wells. (Campbell-NWWA)

OIL WELL DRILLING TECHNOLOGY,
Arthur W. McCray, and Frank W. Cole.
University of Oklahoma Press, Norman, 1958. 492 p, 76 ref.

Descriptors: *Drilling, *Oil industry, Drilling equipment, Rotary drilling, Rock properties, Coring, Permeability, Geophysical methods, Geochemistry, Casing, Drilling fluids, Cements, Oil wells, Radioactive logging, Electrical logging, Logging (Recording).
Identifiers: *Petroleum reservoirs, Well planning, Power plants, Rotary operations, Drill strings, Drill bits, Hoisting operations, Drilling practices, Fishing tools, Formation evaluation, Pressure surges, Pressure anomalies, Casing design, Cementing operations, Drilling economics.

This book is the product of extensive research and practical investigation and is a comprehensive presentation of the procedures identified with this complex subject. It presents a thorough technical discussion of the geological and geophysical principles governing oil accumulation and the drilling of wells from the standpoint of the driller, petroleum engineers, geologist, and student. From a survey of the geological formations likely to contain deposits of oil, it proceeds to methods of discovery, including some radioactive prospecting methods, then to the various types of drilling and drilling tools, to cementing operations, and to costs and ways of paying drilling charges. Practical problems are posed and methods of solving them demonstrated. Graphs, charts, and figures are used freely, along with illustrations of many types of equipment, to aid the driller in visualizing the solution of problems. The experience oilman can find practical answers to many of his problems and questions, the student a sound text for basic principles of oil well drilling. The text provides a complete information on drilling techniques, whether the well is 100 or 20,000 feet deep. (Campbell-NWWA)

DAM FAILURES: AN ASSESSMENT,
Resources Research Centre, Ottawa (Ontario).
A. K. Biswas, and S. Chatterjee.
Pap, Annu Meet Eng Inst Can, Ottawa, Can, Sept 1970. 28 p, 2 tab, 45 ref.

Descriptors: *Dam failures, *Damages, Dams, Disasters, *Concrete dams, *Earth dams, Spillway design flood, Dam foundations, Statistics, Floods, Safety, Reservoirs, Earthquakes, Investigations, Sliding, Landslides, Bibliographies, Operation and maintenance, Warning systems, Foreign.
Identifiers: Research, Dam stability, Overtopping, Spillway capacity, Canada.

Large dams and reservoirs create a complex new environment, and very little is known about the mutual interactions of the component forces to keep the newly created man-imposed systems and nature in a proper equilibrium on a long-term basis. Dams, like other structures, are subject to decay and deterioration with the passage of time and do fail occasionally. Many lessons can be learned from the study of dam failures. Several case studies of failures and disasters involving dams and reservoirs are presented. Careful analyses of more than 300 dams from all over the world indicate that: 35% of the failures are caused by exceedance of the spillway design floods; 25% are caused by foundation problems; and the remaining 40% have various causes such as improper design and construction, improper operation and maintenance, use of inferior-quality materials, and ice and wave action. USBR VIBRATION TEST SYSTEM,
Bureau of Reclamation, Denver, Colo.
R. M. McCafferty.
Pap, 41st Shock Vib Symp, Air Force Acad, Colo Springs, Colo, Oct 1970. 9 p, 8 fig, 1 tab, 2 ref.

Descriptors: Seismic investigations, Research and development, Test procedures, *Seismic studies, *Test facilities, *Test equipment, Shock tests, Instrumentation, Frequency, Resonance, *Structural behavior, Structural engineering, Failu
Earthquake engineering, Dynamic tests, Dynar
response, Dynamic loads, *Vibration tests.
Identifiers: Vibration exciters.

The electrohydraulic vibration test system of
Bureau of Reclamation is described. The test
facility, testing equipment, control equipment,
strumentation, and analysis equipment of
system are discussed, and testing and analy
methods used on the present testing program
described. The system is used primarily for det
mining the structural response of reinforc
concrete specimens. Programs are being c
sidered for other dynamic problems such as str
ture-foundation interaction, hydrodynamic effe
dynamic material properties, and response of st
structures. The vibration test system is capable
testing a wide variety of specimens from very sm
to quite large masses, the upper limit of specim
size being restricted only by available space or
exciter rating. (USBR)

methods.

First developed as a temporary structure to excl
water from excavations, cellular cofferdams
being used as temporary and permanent structu
to retain soil, water, or both. Cellular cofferda
are used in lieu of earth or rockfill cofferda
when the width of the structure must be sm
when a vertical face is required, or when stabi
against scour is required. Design theories, sig

t design and construction considerations, and formance of cellular dams are reviewed. Cellucofferdams normally are double-wall retaining ctures constructed of interlocking steel sheet s forming adjacent cells that are filled with soil ock fragments. Common shapes of cells are cir-ar, diaphragm, and cloverleaf. Cells may be arged along straight lines or lines having uniform variable curvatures. High cellular cofferdams be provided with a berm on the unloaded side ncrease stability. A berm of riprap may be prod on the water side to protect against scour. ular cofferdams are founded on rock where ible, and cell fill should be a face-draining esionless soil; however, many are founded on and some cell fills of rather impervious cohesoil have performed satisfactorily. Has 29 rences. (USBR)

MPLETE ADJUSTMENT METHOD FOR ALYZING ARCH DAMS,
BA-CONSULPRESA, Lisbon (Portugal).
Serafim.
: Amer Soc Civ Eng, J Struct Div, Vol 96, No , p 1711-1734, Aug 1970. 24 p, 15 fig, 17 ref, 2 end.

criptors: Dams, *Concrete dams, *Arch dams, m design, Arches, *Analytical techniques, eign design practices, Bibliographies, Shell ctures, Displacements, Deformation, Stress ysis, Structural analysis, Stress, Cantilevers, arch dams, Computer applications, Matrix nods (Structural), Double-curvature arch s.
tifiers: Shell theory, Portugal.

method assumes the arch dam to be divided 2 systems--arches and cantilevers--formed by ssoirs (elements). In the voussoirs at the sing of arches and cantilevers, all internal es and external loads are considered and the plete set of equations of equilibrium is blished. Also considered are the 3 components near displacements and the 6 rotations of the nals to the faces. For continuity and equilibriof shear stresses, torsions of the horizontal and ical axes are not independent and vertical and ential displacements must be taken simultaney. Internal forces are obtained by solving a em of equations of compatibility which express al displacements at the crossing of arches and ilevers. Both systems of elements are analyzed triangular unit loads, for which the coefficient fluence of the various displacements are deterod. The method presents a matrix formulation he arches and a general formula for the cantils. Results obtained for 2 test dams using the nod show excellent agreement with results of erical methods developed in Great Britain. paring results of model tests for 5 double-curre arch dams indicates that the method is one e more exact. LUENCE ON THE BEHAVIOUR OF AN CH DAM OF THE HYDROSTATIC PRESE ON THE GROUT CURTAIN AND OF THE ESSES IN THE GROUND UPSTREAM,
oratorio Nacional de Engenharia Civil, Lisbon tugal).
Rocha.
Int Congr Large Dams, Montreal, Can, Vol 4, st No 39, p 541-558, June 1970. 18 p, 16 fig, 4

criptors: *Concrete dams, Arch dams, Dam gn, Dams, Stress, Dam foundations, *Structural avior, *Hydrostatic pressure, Grout curtains, sile stress, Displacements, Cracks, Model tests, del studies, Effects, Foreign research, Design ria, Mathematical analysis, Test procedures, gn practices.
tifiers: Foundation models, Portugal.

Two phenomena usually not taken into account in the design of concrete dams are: (1) tensile stresses in the foundation rock upstream from the dam caused by downstream displacements of the dam under hydrostatic pressure; and (2) the influence of the action of hydrostatic pressure on the grout curtain. Model studies to determine the influence of these phenomena show that loading of a dam develops tensile stresses in the upstream foundation that can produce cracks when the stresses are not offset by a pre-existing compressive state of stress. The foundation cracks may influence the state of stress in the lower upstream zone of the dam. The influence can be considerable when the design is affected by tensile stresses in the upstream toe of the dam. The action of hydrostatic pressure on the grout curtain induces non-negligible stresses in the dam which usually improves the state of stress caused by hydrostatic pressure on the dam. (USBR)

RESPONSE OF OFFSHORE STRUCTURES TO RANDOM WAVE FORCES,
California Univ., Berkeley. Dept. of Structural Engineering.
Anil K. Malhotra, and Joseph Penzien.
ASCE Proceedings, Journal of the Structural Division, Vol 96, No ST10, p 2155-2173, October 1970. 19 p, 12 fig, 1 tab, 16 ref, 2 append.

Descriptors: *Waves (Water), *Offshore platforms, *Structural behavior, *Structural design, Structural stability, Design, Towers, Structural analysis, Deflection, Stress analysis, Structural engineering.
Identifiers: *Offshore structures, *Wave forces.

The structural response of towers in deep waters can be reasonably well estimated through a statistical approach which assumes sea flow conditions as stationary gaussian processes by the one-dimensional wave height spectrum and Airy's linear wave theory. Extreme value statistics enable computation of the most probable peak values of the structural response. The response of a tower can be represented fairly accurately by considering only the first two or three lateral modes of vibration. It is desirable to set the leg spacing for the tower in the region of half the wave length, corresponding to the peak frequency of the wave height spectra. As this peak frequency is a function of the wind velocity, a number of alternative critical velocities may have to be examined. A symmetrical structure subjected to symmetrical flow will not experience cross drag inertial forces; thus, no torsional stresses will be introduced. However, due to eccentricities and cross flow, torsional stresses will be introduced and should be checked. These stresses can be significant when the first torsional mode and the first bending mode have frequencies which are close together. (Knapp-USGS)

HYDRAULIC TESTING OF HOLE UAe-7h, AMCHITKA ISLAND, ALASKA,
Geological Survey, Denver, Colo.
Wilbur C. Ballance.
Available from NTIS, Springfield, Va 22151 - Price $3.00 printed copy; $0.65 microfiche. Geological Survey Report USGS-474-484, 1970. 35 p, 15 fig, 1 tab, 2 ref. USAEC Agreement No AT (29-2)-474.

Descriptors: *Groundwater movement, *Hydraulic gradient, *Drill holes, *Water yield, *Alaska, Aquifers, Drawdown, Injection wells, Test procedures, Pumping, Specific capacity, Water levels, Transmissivity, Hydraulic conductivity, Velocity.
Identifiers: *Underground chamber, Swabbing recovery test.

Hole UAe-7h was hydraulically tested in support of the U.S. Atomic Energy Commission's underground nuclear testing program on Amchitka Island, Alaska. Five zones were tested by isolating them with straddle packers. Water bypass around the packers occurred during two of the tests. Because of unstable borehole-wall conditions, favorable locations for setting packers were scarce. The hole was drilled into an intrusive contact zone consisting of highly fractured, hydrothermally altered andesites, metamorphosed breccias, hornfels, and intities. The hole was very difficult to drill because the fractured rock constantly caved from the hole wall and considerable time was required to clean the caved material from the hole. The constant caving resulted in an enlarged borehole often beyond the capacity of the packers to expand. The relative specific capacity (computed from injection test data) of the tested intervals ranges from 0.65 to 1.94 cubic meters per day per meter (0.037 to 0.109 gallons per minute per foot) of drawdown. (Woodard-USGS)

FLOOD ROUTING THROUGH STORM DRAINS: PART IV - NUMERICAL COMPUTER METHODS OF SOLUTION,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
V. Yevjevich, and A. H. Barnes.
Colorado State University Hydrology Paper No 46, November 1970. 47 p, 16 fig, 4 tab, 6 ref, 3 append. Bureau of Public Roads supported.

Descriptors: *Computer programs, *Flood routing, *Storm drains, *Numerical analysis, Mathematical studies, Routing, Equations, Unsteady flow, Mathematical models, Waves (Water), Critical flow, Supercritical flow, Flow, Storm runoff.
Identifiers: Storm drain flow routing.

Computer-oriented numerical methods are given for solving the Saint-Venant quasi-linear hyperbolic partial differential equations of gradually varied free-surface unsteady flow for storm drains. Various numerical finite-difference schemes, including explicit schemes based on the two partial differential equations, unstable diffusing, upstream differencing, leap frog, Lax-Wendroff, and the specified intervals scheme are analyzed. The specified intervals scheme (derived from the method of characteristics), the Lax-Wendroff scheme, and the diffusing scheme are compared. Flow charts and computer programs for these various numerical methods are given. (Knapp-USGS)

PROCEDURE FOR COMPUTING THE ELASTIC SEEPAGE REGIME IN CONFINED AQUIFERS,
S. N. Numerov, and R. M. Barsegyan.
TT-55062. Available from NTIS. Translation of Izvestiya Vsesoyuznogo Nauchno-Issledovatel'skogo Instituta Gidrotekhniki, Vol 86, p 48-59, 1968. Transactions of the Vedeneev All-Union Scientific Research Institute of Hydraulic Engineering, Vol 86, p 43-54, Israel Program for Scientific Translations 1970. 12 p, 4 fig, 1 tab, 5 ref.

Descriptors: *Groundwater movement, *Confined water, *Aquifers, *Darcys law, *Elasticity (Mechanical), Permeability, Transmissivity, Aquicludes, Compressibility, Percolation, Seepage.
Identifiers: *Elastic seepage.

A procedure is given for computing nonsteady seepage, according to Darcy's law, of groundwater in confined aquifers when the elasticitics of the liquid, and low-permeability strata are taken into account. It is assumed that the low-permeability stratum is homogeneous, and that the permeabilities of the aquifers vary only in the vertical direction. The following assumptions are made: (1) seepage in the low-permeability stratum is vertical; (2) the piezometric heads in the aquifers are constant in the vertical direction. (Knapp-USGS)
W71-05455

SOLUTION OF A BOUNDARY VALUE PROBLEM OF NONSTEADY SMOOTHLY VARYING FLOW OF A LIQUID BY THE IMPLICIT FINITE-DIFFERENCE METHOD,
A. I. Fedorenkov.
TT-55062. Available from NTIS. Translation of Izvestiya Vsesoyuznogo Nauchno-Issledovatel'skogo Instituta Gidrotekhniki, Vol 86, p 127-133, 1968. Transactions of the Vedeneev All-Union Scientific Research Institute of Hydraulic Engineering, Vol 86, p 121-127, Israel Program for Scientific Translations 1970. 7 p, 2 fig, 3 ref.

Descriptors: *Open channel flow, *Numerical analysis, *Unsteady flow, Mathematical studies, Equations, Linear programming, Boundary processes.
Identifiers: Samt-Venant equation.

An implicit finite-difference method is presented for solving the boundary-value program for Saint-Venant's equation, which describes nonsteady smoothly varying open-channel flow. The derivatives along the flow, are replaced by symmetric finite-difference ratios at interior points of the stretch considered, and by finite-difference equations. (Knapp-USGS)

FINITE-DIFFERENCE SCHEMES COMPARED FOR WAVE-DEFORMATION CHARACTERISTICS IN MATHEMATICAL MODELING OF TWO-DIMENSIONAL LONG-WAVE PROPAGATION,
Army Coastal Engineering Research Center, Washington, D.C.
R. J. Sobey.
CERC Technical Memorandum No 32, Nov 70. 36 p, 5 ref.

Descriptors: *Waves, *Mathematical models, *Tides.
Identifiers: Long waves, *Wave propagation, Finite-difference schemes, *Storm surge, Tides.

The wave-deformation characteristics of several difference schemes for two-dimensional long-wave propagation are compared by means of the propagation factor introduced by J. J. Leendertse. The schemes compared are those proposed by N. S. Heaps, R. O. Reid and B. R. Bodine, J. J. Leendertse, and M. B. Abbott, respectively. The study also demonstrates the differing behavior of explicity and implicit schemes. (CERC)
W71-05654

MEASURING DIRECTIONAL VELOCITY IN WATER WAVES WITH AN ACOUSTIC FLOWMETER,
Army Coastal Engineering Research Center, Washington, D.C.
R. H. Multer.
CERC Technical Memorandum No 31, Apr 70. 27 p.

Descriptors: *Oceanography, *Instrumentation, *Waves, *Flowmeters.
Identifiers: Dynamic oceanography, Wave-direction sensor, Acoustic flowmeter.

This report contains the technical details of an investigation which was undertaken to adapt an acoustical flowmeter to a device for measuring velocities in water-wave phenomena. The flowmeter studied was designed to measure the difference in travel times of two acoustical pulses traveling simultaneously in opposite directions along a common path. Because of viscous effects, a zone of low velocity flow occurs behind each probe and the measured velocity is somewhat less than the actual velocity when the angle between the acoustical path and velocity vector, theta, is small. When this angle is relatively large, the wake has little effect on the velocity and V measured = V actual x cos theta. It is shown in this report that the wake effect may be eliminated by making simultaneous measurements along multiple paths. (CERC)
W71-05656

CERC WAVE GAGES,
Army Coastal Engineering Research Center, Washington, D.C.
Leo C. Williams.
CERC Technical Report No 30, Dec 1969. 124 p.

Descriptors: *Ocean waves, *Instrumentation.
Identifiers: Ocean-wave gages, Oceanographic instrumentation, Step-resistance wave gages, Strip-chart wave records, Wave-record analyzer (Magnetic tape).

CERC has used wave gages to gather prototype wave data since 1948. Two basic types of gages are now used in the field - the step-resistance staff gage and the underwater pressure-sensitive gage. CERC has developed three types of step-resistance staff gages - a series type for use in fresh water, a parallel type for use in salt water, and a relay-operated type for use in either fresh or salt water or in water where wide changes in salinity occur. The pressure gage can be used in water of any salinity. The series and parallel gages have an accuracy of plus or minus 5 percent plus the spacing of one sensor increment. The relay gage has an accuracy of plus or minus 2 percent plus the spacing of one sensor increment. The accuracy of the pressure-sensitive gage is not as precise as that of the step-resistance gages. The report describes each gage and the theory of operation, details of fabrication, steps for calibration and installation, and requirements of maintenance. (CERC)

BULLETIN AND SUMMARY OF RESEARCH PROGRESS, FISCAL YEARS 1967-69.
Army Coastal Engineering Research Center, Washington, D.C.

CERC Bulletin III, July 1970. 72 p.

Descriptors: *Coastal engineering, Shore protection, *Riprap, Ecology, *Beach erosion.
Identifiers: Shore processes, *Environmental data collection, Sediment tracers, Wave diffraction, Hurricane protection, Beach nourishment.

This Bulletin consists of 3 articles and a summary of CERC research for FY's 1967-69. The lead article describes hurricane protection in New England harbors. Operation of the gates is described; and based on records of storms since 1935, prevention of losses is projected. A Method for Driving Pipe in Beach Rock describes placing pipe economically to obtain beach profiles without surveying. Wave Diffraction in a Laboratory Movable-Bed Setup discusses how diffraction causes deleterious results. Summary of Research: Wind-Wave Action in Coastal Waters - Studies in coastal areas and wave tanks reported. Shore Processes - CERC studies cover alongshore transport, suspended material, sand simulants, beach profiles and dune building. Long-Period Waves and Surges - Analyzes harbor surging, tsunamis, 2-dimensional long waves. Shore Protection in Bays, Lakes and Reservoirs - Study in Chesapeake Bay by CERC. Biological-Ecological Studies - Program to use offshore sources of sand to nourish beaches; create bottom conditions favorable to marine life; research the effects of waste dumped in the N.Y. Harbor. Environmental Data Collection - CERC studies on sand inventory, sand tracers, wave analysis, wave sensors and surf observation. A laser wave gage was tested at Atlantic City, N.J. Publications - A list of publications for FY's 67-68-69. Miscellaneous Tests - Riprap in reservoirs of the Missouri River Division; sand-filled nylon bags; synthetic seaweed; special techniques for coastal construction; corrosion of steel piling in sea water; and sand slurry abrasion of coated steel pilings. (CERC)

GENERAL INDUSTRIAL WATER WELL DESIGN FACTORS,
Layne Texas Co., Houston.
O. F. Jensen.
Typescript, 1961. 29 p.

Descriptors: *Water wells, *Drilling, Rotary drilling, Cementing, Aquifers, Specific capacity, Sampling, Drilling equipment, Drawdown, Groundwater.
Identifiers: *Well hydraulics, *Well development, Pilot holes, Calbe tool drilling, Quantitative hydrology, Pump tests, Well interference.

Industrial water well design may best be defined as a progressive quantitative evaluation using engineering principles of several scientific fields. This procedure must necessarily be coordinated with the methods of testing and construction. The design must be based on the natural geologic, hydrologic and chemical conditions of the groundwater prevailing in the area of a proposed well. The pumping rate, or yield, and quality of water produced are direct functions of these natural conditions. The design of a water well system embraces several phases. The preliminary survey of the proposed well location together with the drilling of a test hole or pilot hole survey provide basic data on the prevailing geologic, hydrologic and chemical quality of the goundwater conditions in a proposed area. These data together with application of water well testing and construction methods provide the basis for determining a well design that will result in the most favorable operational performance. The preliminary survey, test hole or pilot hole survey of a proposed well location, construction methods and well hydraulics are discussed in this paper. (Campbell-NWWA)

WELL DEVELOPMENT, A PART OF WELL COMPLETION,
Williams and Works, Grand Rapids, Mich.
Edward M. Burt.
Typescript, 1970. 15 p.

Descriptors: *Water wells, *Wells, Drilling, Groundwater, Equipment, Rotary drilling, Gravel packing, Casting, Turbine pump, Muriatic acid, Screens, Michigan.
Identifiers: Cable tool drilling, Water well construction, Surge block, Horizontal jet nozzle, Air-lift pump, Vertical turbine pump, Explosives, Chlorination.

The object of this paper is to emphasize that part of water well completion known as well development. Some of the available tools are illustrated and various techniques discussed. It illustrates the fundamental elements of the basic types of wells found in Michigan, wherever water bearing unconsolidated formations rest on water bearing formations. The purpose in well development during the construction of a well, is to accomplish the design goal of maximum, sand-free capacity. In the design phase the selection of a screen and whether or not artificial gravel packing is necessary, combined with the selection of the method of drilling, are the important considerations. The paper is well documented and well illustrated. (Campbell-NWWA)

ddy viscosity, *Eddy diffusion coefficient,
hermal pollution.

plane, horizontal, two-dimensional, incompressi-
e, turbulent wall-jet of air was studied experimen-
ly. The air flow emerged from a 35 in. wide,
52 2 in. high slot at 110 ft/sec tangentially to a 35
by 143 in. horizontal flat plate bounded by
eboards. Mean and turbulent flow charac-
istics were measured in the similarity and the en-
nce regions up to a distance of 123.6 nozzle
ights from the nozzle exit. Mean velocity
rections and components of the Reynolds stress
nsor were measured with a single rotatable hot
re. Magnitudes of the mean velocity were ob-
ned with a Pitot tube. The hot wire set was a con-
nt temperature hot wire anemometer equiped
th a linearizer. Results indicate that the distribu-
ns of the mean velocity directions do not
come similar with increasing distance from the
zzle. The self-similar form of the non-dimen-
nal mean velocity profile develops within a
stance of about 9 nozzle heights from the nozzle
it. It appears that the various turbulence intensi-
s and the Reynolds shear stress reach similarity
tes at different distances between 16.3 and 20.1
zzle heights from the nozzle exit. The concept of
dy viscosity does not promise to be very useful in
aling with wall jets. Values determined with mea-
red Reynolds shear stresses and mean velocity
adients show that the eddy viscosity changes very
pidly and in a complex way in the vicinity of the
ll and has even a singularity at or near the locus
mean velocity maxima.

HIGH HEAD GATE SEAL STUDIES,
Bureau of Reclamation, Denver, Colo. Office of Chief Engineer.
Edward J. Traut.
Available from NTIS as PB-195 741, $3.00 in paper copy, $0.95 in microfiche. Report No REC-OCE-70-37, August 1970. 18 p, 2 tab, 11 fig.

Descriptors: *Gate seals, *High pressure gates, High pressure, Seals, Stoppers, Test procedures, *Laboratory tests, Physical properties, Hydraulic gates and valves, Friction, Test facilities.
Identifiers: *High head, Fluorocarbons, Friction coefficient (Mech), Test results.

Studies were continued on rubber seals to determine the most suitable seal for use on wheel and roller-mounted gates operating under very high heads. The major problem encountered during the closing cycle under unbalanced pressure conditions is the pinching of the seal bulb between the seal clamp and seal seat. Seven factors affecting this pinching were varied in attempts to find the optimum seal assembly capable of withstanding high pressure heads. Ten double-stem seal variations using combinations of stem thickness, fluorocarbon cladding, and rubber compositions were tested at heads up to 600 ft (182.88 m). Tests were conducted in a special test rig accomodating 12-1/8-in.-long (30.798-cm) seal specimens. Tests consisted of measuring the seal bulb extension and photographing and observing general behavior of the seal under load during simulated opening and closing cycles of the gate.

SOME RESULTS OF MODEL TESTS ON FRANCIS HYDRAULIC TURBINES,
N. T. Klyuikov.
Available from NTIS as PB-193 632T, $3.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation, Denver, Colo. Trans. from Energomashinostroyenie No 4. Translation No 708, August 1967. 16 p.
Identifiers: *Turbines, *Turbulence, Vortices, Turbine blades, Cavitation, Hydraulic systems, Model tests, Vibration, USSR, Francis turbines, Turbine runners, Translations.

Investigation of vortical turbulence behind Francis turbine runner models showed the causes for formation of vortical turbulence behind the runner, leading to increased cavitation and vibration of the unit. Five different models of runners having a constant draft tube height with a greater than critical cavitation coefficient were compared by visual observation, velocity measurements, linear measurements of vortical flow diameter parallel to and 100 mm from the lower plane of the band, and ratio of the diameter of vortical disturbance to the diameter of the draft tube entrance. Then the results of flow torsion measurements at the runner exit were compared with the calculated data obtained by computing the effect of the distributor. Conclusions were: (1) Vortical turbulence behind runner is caused by a torsion of flow at the runner outlet. (2) During runner design calculations, flow torsion at the runner exit should be considered, taking into account the unevenness of the flow torsion created by the distributor. (3) For Francis turbines with a specific speed of 200, the flow torsion can be defined satisfactorily and the meridional projection of the blades chosen so that the hub velocity equals zero or is slightly negative. SHORT-CIRCUIT FORCES IN SWITCHGEAR INSTALLATIONS,
G. Schaffer.
Brown Boveri Rev, Vol 57, No 6/7, p 303-309, June-July 1970. 7 p, 10 fig, 11 ref.

Descriptors: *Short circuits, Stress, *Switchgear, Electrical equipment, Oscillations, Magnetic fields, Bus (Electrical), *Bundled conductors, Electric current, Electric fields, *Electric conductors, Electric cables, Plastic deformation, Foreign research, Electrical.
Identifiers: Engincering, Transmission (Electrical), Switzerland.

The physical causes, behavior with respect to time, and form of the forces acting between live conductors are considered, and design measures for dealing with short-circuit forces in switchgear installations are discussed. The forces created by a short circuit are not static, but oscillate at twice the power frequency. Danger exists if the natural frequency of the bus bar is close to double the power frequency because resonance can occur. Mechanically strong (rigid) bars usually transfer much greater forces to post insulators than do mechanically weak bars. Bundled conductors encounter 2 kinds of stresses, those between phase conductors and those between the conductors of the bundle. Bundle forces are large because of the proximity of the conductors. As a result of the large bundle forces, conductors move rapidly toward each other during short circuits, causing a shortening of the span and high stresses on equipment. Suspended connections and jumpers swinging violently under the influence of short circuits are particularly vulnerable in high-voltage equipment. Electrical clearances may be greatly reduced under these conditions. Care must be taken with bundled conductors in outdoor switchgear where short-circuit currents may exceed 70,000 amperes. (USBR)
W71-05724

UNBALANCED TENSIONS IN TRANSMISSION LINES,
Pacific Gas and Electric Co., San Francisco, Calif.
D. B. Campbell.
Proc Amer Soc Civ Eng, J Struct Div, Vol 96, No ST10, p 2189-2207, Oct 1970. 19 p, 13 fig, 1 tab, 8 ref, 2 append.

Descriptors: Electric conductors, Computers, *Transmission lines, Ice loads, *Matrix methods (Structural), *Transmission towers, Structural engineering, *Stiffness, Numerical analysis, Electrical insulators, Suspension insulators, Digital computers, Structures, Accuracy, Errors, *Tension, Torsion, Bending, Analysis, Computer applications.
Identifiers: Iteration method.

A nonlinear analysis of an electric transmission line is presented for conditions involving imbalance in conductor tensions. The analysis is applicable to lines containing structures of arbitrary geometry and stiffness. Structure and insulator displacements are considered. Stiffness properties of structures, conductors, and insulators are derived. Equilibrium equations to be used in the analysis are formed. Two numerical methods of analysis, an iteration method, and a step-by-step linear increment technique are applied to the equilibrium equations. Both methods were programed on a digital computer and were applied to an actual transmission line containing flexible tubular steel structures. The iteration method was superior to the step-by-step method. Analysis of this line also shows that neglecting deflections of flexible structures with suspension insulators introduces substantial error. (USBR)

8D. Soil Mechanics

COMPARISON OF THE RESULTS OF LABORATORY TESTS WITH DATA OBTAINED BY FIELD OBSERVATIONS OF THE

PERFORMANCE OF THE DRAINAGE SYSTEM IN THE SOIL MASSIF ON THE LEFT BANK OF THE BRATSK HYDROELECTRIC PLANT,
O. N. Nosova.
TT-55602. Available from NTIS. Translation of Izvestiya Vsesoyuznogo Nauchno-Issledovatel'skogo Instituta Gidrotekhniki, Vol 86, p 68-75, 1968. Transactions of the Vedeneev All-Union Scientific Research Institute of Hydraulic Engineering, Vol 86, p 63-70, Israel Program for Scientific Translations 1970. 8 p, 3 fig, 1 ref.

Descriptors: *Drainage systems, *Anisotropy, *Analog models, Model studies, Drainage wells, Reservoirs, Dams, Subsurface drainage, Hydroelectric plants.
Identifiers: *Bratsk (USSR).

Electrical analog models were used to study and plan a drainage system for anisotropically fissured rock at the Bratsk power station, USSR. The drained area consists of lower Silurian sandstone and siltstone covered by a thin layer of Quaternary sediments of low permeability, with underlying thick layers of trap intrusions of diabase which are practically impervious. The permeability of the sandstone and siltstone increases from the bottom toward the top. Certain layers in the central and upper parts of the aquifer have permeabilities exceeding 100 m/day. Due to the geological structure of the site the seepage conditions are most unfavorable. Tests carried out on a three-dimensional electrical-analogy installation at the Seepage Studies Laboratory showed that construction of a grout curtain is not advisable, and that favorable seepage conditions in the central part of the zone considered can be ensured solely by a drainage system. The drainage system consists of a single drainage gallery and a number of drainage tunnels. Both the gallery and the tunnel were to be equipped with vertical drainage wells spaced 10 m from one another. Drainage systems consisting of vertical wells were found to be of little value for lowering the saturation surface in anisotropic fissured rock, since leaks may occur over considerable lengths. (Knapp-USGS)

ON THE PROBLEM OF DERIVING A SYSTEM OF EQUATIONS DESCRIBING THE MOTION OF WATER-SATURATED COHESIONLESS SOIL CONSIDERED AS A MULTIPHASE MEDIUM,
L. A. Eisler.
TT-55062. Available from NTIS. Translation of Izvestiya Vsesoyuznogo Nauchno-Issledovatel'skogo Instituta Gidrotekhniki, Vol 86, p 236-245, 1968. Transactions of the Vedeneev All-Union Scientific Research Institute of Hydraulic Engineering, Vol 86, p 231-239, Israel Program for Scientific Translations , 1970. 9 p, 9 ref.

Descriptors: *Sediment transport, *Soil mechanics, *Mass wasting, Compressive strength, Shear strength, Soil physical properties, Flow, Mudflows, Fluid friction, Porous media.
Identifiers: Water-saturated soil.

Soil may be considered as a multiphase medium in which one phase forms the skeleton. The three-dimensional equations of motion for a multiphase medium are written and solved. When the soil contains little air, and surface forces at the interfaces as well as heat exchange between the phases is neglected, it may be assumed that all phases except the skeleton are at the same pressure. The volume strain induced by the effective pressure in the skeleton has to be added to the volume strain of the solid particles, caused by the water pressure. The ratio of these strains must be found by considering the mechanics of the deformation of the soil skeleton and of the particles of which it is composed. When the air content is insignificant the model of the three-phase soil may be simplified and reduced to the model of a two-phase soil. (Knapp-USGS)

MECHANICS OF SLIDE DAMS,
Agbabian-Jacobsen Associates, Los Angeles, Calif.
G. A. Young.
Pap, Symp Eng Nucl Explos, Las Vegas, Nev, p 1198-1221, Jan 1970. 24 p, 21 fig, 20 ref.

Descriptors: *Earth dams, *Rockfill dams, *Nuclear explosions, *Dam construction, Dam design, *Landslides, Dams, Soil mechanics, Mechanics, Model studies, Model tests, Rockslides, Slopes, Construction, Design criteria, Laboratory tests, Bibliographies, Scale effect, Construction methods, *Explosive construction.
Identifiers: *Slide dams.

Problems associated with the construction of slide dams by nuclear explosives are considered. Characteristics of conventional earth and rockfill dams based upon proven techniques developed after many years of experience are examined, and characteristics of natural landslide dams are considered to identify potential problems that must be over-come by slide dam construction techniques. Mechanics of slide dams as determined from small-scale laboratory studies are presented. Many important features of conventional dams must be incorporated into the design of slide dams. For example, foundation treatment and adequate diversion and spillway capacity must be provided, and adequate provisions must be made to control seepage and prevent piping. Important lessons can be learned from observing the characteristics of natural landslides; however, slide dams created by man must provide better results than have been observed in nature. Limited laboratory studies helped define the general phenomena of the mechanics of slides and indicated that the phenomena can be scaled. Conclusions are that slide dams can be constructed and that small-scale field tests and additional laboratory studies are justified. Has 20 references. (USBR)
W71-05729

METHODS OF ESTIMATING LATERAL LOADS AND DEFORMATIONS,
Alberta Univ., Edmonton.
N. R. Morgenstern, and Z. Eisenstein.
Lateral Stresses Ground Design Earth-Retaining Struct, 1970, Spec Conf, p 51-102, Cornell Univ, Ithaca, NY, June 1970. 52 p, 19 fig, 1 tab, 65 ref, append.

Descriptors: *Lateral forces, *Earth pressure, Loads (Forces), Stress, *Soil mechanics, *Deformation, Retaining walls, Soil pressure, Effective stress, Elastic theory, Safety factors, Cuts, *Analytical techniques, At rest pressure, Strain, Theory, Methodology, Boundary conditions, Foreign design practices, Bibliographies, Finite element method.
Identifiers: Empirical methods, Canada.

Methods for estimating lateral earth pressures and deformations are classified into 3 groups: (1) problems of small deformations where lateral pressures and deformations may be computed using elastic theory; (2) problems of small to moderate deformations where lateral pressures are computed using limit equilibrium methods and deformations are controlled by choice of a suitable factor of safety; and (3) problems of moderate to large deformations where lateral pressures and deformations are estimated by semiempirical methods. Application of each method within the 3 groups is subject to limitations. An important limitation occurs because of lack of knowledge of boundary conditions such as those that describe the way walls move, the way excavations are braced, and the stress displacement conditions away from the zone of concern. Successful application of any method can be expected only if soil and pore pressure data are representative. Questions of time dependence of strength or anisotropy may be very important in estimating lateral pressure, and changes in pore pressure and subsequent consolidation may control deformation; in most cases where these unknowns prevail, use of the more advanced theories is superfluous. CONSTANT LOADING RATE CONSOLIDATION TEST,
Hiroshima Univ. (Japan)
H. Aboshi, H. Yoshikuni, and S. Maruyama.
Soils Found, Vol 10, No 1, p 43-56, Mar 1970. 14 p, 13 fig, 1 tab, 1 photo, 8 ref.

Descriptors: Consolidation, *Soil consolidation tests, Soil mechanics, Soil engineering, *Soil tests, Laboratory tests, Test procedures, Clays, *Loading rate, Preconsolidation, Methodology, Theory, Foreign research, Pore pressure, Settlement (Structural), Preconsolidated soils, Effective stress, Comparative studies.
Identifiers: Compression index, Consolidometers, Time saving, Japan.

Frequent measurements for about 10 days are usually required to determine consolidation characteristics of clayey soils by the standard consolidation test. For this reason, the standard test is considered one of the most time consuming and troublesome among routine laboratory soil tests. A consolidation test method using constant rates of loading is proposed as an alternative to the standard test. Consolidation tests using the proposed method are completed in 2 to 3 hr, and settlement and base pore pressure can be measured and recorded automatically. Results from the proposed test agree well with those from the standard test. Test procedures, theoretical background, and experimental data are presented. (USBR)

8E. Rock Mechanics and Geology

IMPOUNDING OF MANICOUAGAN 5 RESERVOIRS AS POSSIBLE TRIGGER CAUSE OF LOCAL EARTHQUAKES,
SNC, Inc., Montreal (Quebec).
R. Kall, and S. Charalambakis.
10th Int Congr Large Dams, Montreal, Can, Vol 3, Quest No 38, p 795-814, June 1970. 20 p, 5 fig, 52 ref.

Descriptors: *Reservoirs, *Seismic studies, *Subsidence, *Earthquakes, Faults (Geology), Subsurface investigations, Stress, Instrumentation, Settlement (Structural), Dams, Geology, Breccia, Foreign research, Water pressure, Bibliographies, Safety, Seismology, Investigations, History, Seismic stability.
Identifiers: Canada, Seismic sources, *Manicouagan 5 (Canada), Tectonics.

In view of several recorded case histories, loading of the Manicouagan 5 Reservoir could trigger local earthquakes. Impounding of the reservoir is in progress and studies have been made of the impounding at Hoover Dam reservoir in the U.S., the filling of Kremasta and Marathon Lakes in Greece, the pressure-filling of a deep well near Denver, Colo. (in the U.S.), and other cases where loading of a relatively small area of the earth's crust has triggered local earthquakes. Loading and subsidence of reservoir areas are not sufficient for causing earthquakes; tensions must be present in the crust so that unstable conditions prevail under the reservoir area. Only then can an extra load become a trigger to release earthquakes. The Manicouagan 5 Reservoir area is very unique and possibly an unstable structure. The origin of the well-defined, circular feature dates back to a meteor impact in the Triassic period. The explosion created a circular graben structure, the major faults being occupied by Lakes Manicouagan and Mushalagan. Rocks of the reservoir area are different from those of the surrounding Shield, being crushed, brecciated, fragmented, and fractured to a

reat depth. The reservoir area is isostatically unable and presumably in a process of uplift. USBR)

OW-HYGROSCOPIC PLASTICIZED LUGGING CEMENT,
ureau of Reclamation, Denver, Colo.
. N. Khangil'din.
vailable from NTIS as PB-193 590T, $3.00 in aper copy, $0.95 in microfiche. Translated from: sement, No 4, p 5-7, 1965. Bureau of Reclamaon Translation No 663, May 1966. 11 p, 3 fig, 3 b, 3 ref.
entifiers: *Well completion, *Ethanolamines, ortland cement, Translations.

oviet researchers have developed a new highuality plugging cement for use in oil prospecting evelopmental work in Siberia. The good storage operties and wettability of this cement were obined by adding monoethanolamine during illing. Because a better storing cement was eeded for cold humid conditions, a research team om several institutes cooperated to determine hat additives yielded the best plugging cement in rms of wettability, strength, viscosity, and other operties. Amino alcohols, mono-, di-, and iothanolamine, were tested using both high- and w-aluminate cements with and without sodium loride. The paper discusses the properties eeded in the new cement, developmental test ethods, and results leading to the choice of onoethanolamine as the most effective additive r cold or hot drill holes at the recommended rate 0.5 to 1%, by weight of cement. Slag-portland ement (40% slag) with admixtures of 1% NaCl nd 0.5% monoethanolamine during milling kept a gher strength and flowability in spite of the NaCl ontent (added to raise the hygroscopic properes). Monoethanolamine lowers water permeabilit of cement mortar, does not corrode iron, intensies the milling process to produce finer grinds, ineases water-cement ratio, and lowers the specific eight of the grout (important when grouting deep ill holes).

entifiers: *Crack propagation, Microcracks, onic-pulse test.

ltrasonic measurements were used successfully as ternal indicators of changes in internal microsuctures of concrete subjected to monotonically creasing, cyclic, and sustained loading. The elocity and attenuation of ultrasonic pulses transitted across concrete and paste speciments subcted to various types of loading were measured nd compared to surface strains and internal icrocracking. Conclusions are: (1) sonic pulse elocity decreases with increasing length of cracks; 2) increasing the resonant frequency of the ezoelectric crystals used to produce the sonic ulses increases the pulse velocity and the sensitivi of the ultrasonic measurements to crack growth; 3) failure of concrete involves much more gradual nd extensive crack growth than failure of paste; 4) cyclic and sustained loading of concrete results a relatively slow rate of crack growth when failure does not occur, and as failure approaches, the rate of crack growth increases and ultrasonic measurements change very rapidly; and (5) ultrasonic measurements are helpful in contrasting failure mechanisms of sustained and cyclic loading. CONCRETE-POLYMER MATERIALS--SECOND TOPICAL REPORT,
Brookhaven National Lab., Upton, N.Y.
M. Steinberg.
BNL 50218 (T-560) and Bur Reclam Rep REC-OCE-70-1, Dec 1969. 73 p, 55 fig, 43 tab, 9 ref.

Descriptors: *Concrete technology, Concrete properties, Construction materials, Concrete additives, Concrete tests, Lightweight aggregates, Mechanical properties, *Durability, *Polymers, Radiation, Freeze-thaw durability, Catalysts, Monomers, Strength, Research and development, Impregnation, *Polymer concretes, *Polymerization, Lightweight concretes.
Identifiers: *Concrete-polymer materials.

Extended data on concrete-polymer composites as improved materials for construction are presented. The durability properties, such as freeze-thaw durability and acid and sulfate resistance, and the longer-term mechanical properties were investigated. The investigations were extended to include monomers capable of maintaining strength at elevated temperatures--thermosetting monomers such as the polyesters and epoxies, and, with the use of cross-linking agents, the thermoplastic or lower melting polymers. Measurements of mechanical properties at elevated temperatures (up to 290 deg F) are given. Special concretes (light-weight concrete containing foamed-glass aggregate and fiber-reinforced concrete) were impregnated and tested. Improvements in the structural and durability properties of concrete can be obtained by monomer impregnation and in situ polymerization by either radiation or thermal-catalytic means. (USBR)

CURRENT TECHNIQUES FOR COMBATING DRILL-PIPE CORROSION,
National Lead Co., Houston, Tex. Baroid Div.
H. E. Bush.
Spring Meeting, Southwestern District, Division of Production, American Petroleum Institute, March 16-18, 1966, Hobbs, New Mexico. Reprint, 12 p.

Descriptors: *Corrosion (Pitting), *Drill pipe, *Drilling fluids, Fatigue (Mechanics), Oxidation, Rusting, Anodes, Cathodes, Oil industry.
Identifiers: *Corrosion causes, *Surface corrosion, *Hydrogen embrittlement, Corrosion inhibitors, Aerated drilling fluid.

Corrosion still plays a major role in drill pipe failures. Contaminants such as oxygen, hydrogen sulfide, sodium chloride, and carbon dioxide are commonly found in drilling fluids. Recently recognized sources of contamination are thermodegradation of mud products and inhibited stimulation additives, and these add to the corrosion problem. Physical barriers, such as scale, normally occur inside drill pipe and can result in accelerated corrosion attack. The conditions under which present drilling equipment is used increases the danger of corrosion attack from these contaminants. In recent years, test equipment has been developed and is being used to evaluate corrosion problems and mitigation techniques. Examples of techniques both in the laboratory and the field are given. Case histories of corrosion-inhibitor applications are reported. (Campbell-NWWA)

Identifiers: *Water well equipment library, *Water well maintenance data, Auger rigs, Bits, Cable tool rigs, Down-the-hole hammer, Chlorinators, Turbines.

The National Water Well Association's Master Library contains miniature reproductions of 347 different manufacture's catalogs. Each catalog is preceded by a directory identification frame. The frame lists the manufacturer's NWWA identification number, name, address, telephone number and the name of the individual who is responsible for the sale of that manufacture's products in groundwater systems and development. The Master Library represents the most significant advancement in product information storage and retrieval ever accomplished in the groundwater industry. Through the new science of micropublishing, the NWWA has been able to compile and reproduce actual catalog presentation, of most manufactures to the groundwater industry. Each one has been cross-referenced in a comprehensive index. The contents of this library, in original size, would fill more than six filing cabinet drawers. A 7X handviewer is supplied with the Library. (Campbell-NWWA)

WATER RESOURCES RESEARCH IN VIRGINIA - ANNUAL REPORT FOR FISCAL YEAR 1970,
Virginia Polytechnic Inst., Blacksburg. Water Resources Research Center.

Available from N.T.I.S. as PB-197 993, $3.00 in paper copy, $0.95 in microfiche. Virginia Polytechnic Institute and State University Water Resources Research Center Bulletin 40, December 1970. 166 p. OWRR Project A-999-VA (10).

Descriptors: *Water Resources Research Act, *Virginia, Grants, Research and development, Water resources development, Waste water treatment, Water quality, Groundwater, Hydrogeology, Water resources.
Identifiers: *Water resources research (Va).

An examination of the various water resources problems of Virginia reveals that no one dominant problem is common to all sections of the State. Therefore, the Virginia Water Resources Research Center studied the critical elements of a variety of problems hoping that this approach will provide a large return for each research dollar expended and will be of some assistance to the several areas of the State. Southeastern Virginia is experiencing a severe lowering of water tables due to excessive pumping. The establishment of water quality standards for the streams of the State pursuant to the Water Quality Act of 1965 has had a significant impact on all sections of the State. Development in some northern Virginia communities has been slowed because additional waste water hookups have been enjoined until treatment facilities are modified or improved for increasing the removal of phosphorus and nitrogen. Improved operating parameters were developed for increasing phosphorus removal in the conventional activated sludge process. Activated carbon can be regenerated by an electrochemical process which would be economical for use in small and medium size treatment facilities. The existing biological and chemical condition of the North Anna River, the proposed site of a nuclear electric plant were inventoried. Waste nylon can be used to remove phenol from water. The research results show promise for the removal of this objectionable chemical by utilizing another waste product. The impact on recreational activity of large drawdowns at multiple purpose water reservoirs is being studied. (See also W71-05556 thru W71-05558) (Knapp-USGS)

Identifiers: *Civil Service Commission, *Managerial skills, Engineers status, Career development, Careers.

An important aspect of the job of the 18,000 civil engineers in the Federal service is professionalism. A profession is defined in terms of: mental effort based on an educationally communicable body of knowledge, constant growth of the body of knowledge, dissemination of knowledge to all members, a society with professional requirements for membership, and standards of ethics and performance for all members. The various aspects of personnel management problems that the Federal Government faces in dealing with civil engineers and other professionals are: identifying jobs that require professional competence, setting appropriate qualification requirements, recruiting high-quality engineers and technicians, establishing career patterns that foster development and retention of engineers and technicians, providing training opportunities, identifying high potential for advancement, and providing for appropriate participation of professionals in employee management cooperation programs. The Civil Service Commission seeks the cooperation of civil engineers in achieving a top-notch Federal service.

WATER RESOURCES PUBLICATIONS RELATED TO THE STATE OF NEBRASKA,
Nebraska Univ., Lincoln. Water Resources Research Inst.
Warren Viessman, Jr.
Publication No 2, October 1969. 47 p. OWRR Project A-999-NEB (2).

Descriptors: *Bibliographies, *Nebraska, *Publications, *Water resources, Seepage, Reservoirs, Rainfall, Water utilization, Electric power, Water resources development, Water pollution, Testing, Conservation, Irrigation, Surface waters, Underflow, Watersheds (Basins), Flood control, Planning, Administration, Evapotranspiration, Erosion, Legal aspects, Water distribution (Applied), Drainage, Water wells, Geology, Groundwater, Maps, Water supply, Fisheries, Recreation, Logging (Recording), Water quality, Research and development.

report is a bibliography of water resources
lications dealing with the state of Nebraska.
rly five hundred titles are listed by subject,
ering aspects of water research, administration,
ogy, management, planning, conservation, sur-
and groundwater, and water use. Many
ogic, groundwater, and irrigation maps are also
d. Dates of publication range from 1940 to
8. (Yensen-Arizona)

SUBJECT INDEX

TEMENT
NSTITUTIONAL DESIGN FOR WATER QUALITY MANAGEMENT A CASE TUDY OF THE WISCONSIN RIVER BASIN, VOL. 8, SECTION J - THE CONOMIC AND FISCAL ASPECTS OF A REGIONAL WATER QUALITY ANAGEMENT SYSTEM,
71-05383 05G

ATION
STIMATE OF GLACIERS SECULAR (1948-1966) VOLUMETRIC CHANGE ND ITS CONTRIBUTION TO THE DISCHARGE IN THE UPPER NORTH ASKATCHEWAN RIVER BASIN,
71-05593 02C

RIGINES
ENETIC PROBLEMS OF HOT DESERT POPULATIONS OF SIMPLE ECHNOLOGY,
71-05481 02I

ORPTION
XPERIMENTAL INVESTIGATION OF THE PRODUCTION OF BACTERIA IN ATER AND CONSUMPTION OF BACTERIA BY DAPHNIA, (IN RUSSIAN),
71-05397 05F

ATER BALANCE IN LEAF TISSUE,
71-05709 02D

HE PARTITIONING OF RESISTANCES TO PHOTOSYNTHETIC CARBON IOXIDE UPTAKE IN THE LEAF,
71-05713 02I

TRACTS
ATER RESOURCES RESEARCH IN NEBRASKA,
71-05468 09A

NDANCE RATIOS
OME BIOGEOCHEMICAL CONSIDERATIONS ON THE RADIOACTIVE ONTAMINATION OF MARINE BIOTA AND ENVIRONMENTS,
71-05531 05A

ESS ROUTES
OBINSON V FRED B HIGGINS CO (CONSTRUCTION OF PIER REQUIRES ERMISSION OF UPLAND OWNER).
71-05391 06E

RETIONS(LEGAL ASPECTS)
LLMASTER V ZEIDLER (ADVERSE POSSESSION OF RIPARIAN TRACT ND ITS ACCRETIONS).
71-05536 06E

RETION(LEGAL ASPECTS)
LLEN V WOOD (TITLE TO ACCRETIONS TO SEASHORE).
71-05367 06E

OF GOD
UPERIOR COAL AND BUILDERS SUPPLY CO V BOARD OF EDUC IABILITY FOR ALTERATION OF NATURAL LAND DRAINAGE).
71-05668 06E

IVATED CARBON
DVANCED WASTE WATER TREATMENT USING POWDERED ACTIVATED ARBON IN RECIRCULATING SLURRY CONTRACTOR-CLARIFIERS,
71-05386 05D

HE DEVELOPMENT OF A FLUIDIZED-BED TECHNIQUE FOR EGENERATION OF POWDERED ACTIVATED CARBON,
71-05388 05D

IVATED SLUDGE
ASTES FROM PIG PRODUCTION UNITS,
71-05428 05D

NGI ASSOCIATED WITH THE ACTIVATED-SLUDGE PROCESS OF SEWAGE EATMENT AT THE LEBANON, OHIO, SEWAGE-TREATMENT PLANT,
71-05624 05D

IVATED SLUDGE PLANT EFFLUENT
DVANCED WASTE WATER TREATMENT USING POWDERED ACTIVATED ARBON IN RECIRCULATING SLURRY CONTRACTOR-CLARIFIERS,
71-05386 05D

PTATION
ERRESTRIAL DESERT ARTHROPODS FAUNA AND ECOLOGY,
71-05478 02I

NETIC PROBLEMS OF HOT DESERT POPULATIONS OF SIMPLE ECHNOLOGY,
71-05481 02I

DICATION PROCEDURE
NNIG V GRAHAM (INJUNCTION TO PREVENT FISHING IN PRIVATE REAM AND SPRING).
71-05661 06E

LOYD COUNTY V FINCHER (RECOVERY OF DAMAGES FOR PERMANENT JURY FROM NUISANCE).
71-05829 06E

NISTRATION
ATER RESOURCES REGIONS AND SUBREGIONS FOR THE NATIONAL SSESSMENT OF WATER AND RELATED LAND RESOURCES.
71-05775 06B

NISTRATIVE AGENCIES
ECUTIVE ORDER 11548 (DELEGATED FUNCTIONS OF THE PRESIDENT DER THE FEDERAL WATER POLLUTION CONTROL ACT).
71-05488 06E

DELEGATION OF RESPONSIBILITY TO CARRY OUT CERTAIN PROVISIONS OF FEDERAL WATER POLLUTION CONTROL ACT.
W71-05490 06E

EXECUTIVE ORDER 11523, ESTABLISHING THE NATIONAL INDUSTRIAL POLLUTION CONTROL COUNCIL.
W71-05814 06E

ADSORPTION
THE DEVELOPMENT OF A FLUIDIZED-BED TECHNIQUE FOR REGENERATION OF POWDERED ACTIVATED CARBON,
W71-05388 05D

SORPTION AND DESORPTION OF CHLORINATED HYDROCARBON PESTICIDES BY CLAY MINERALS,
W71-05447 05B

MERCURY ADSORPTION OF CHROMIUM OXIDE GELS,
W71-05598 05A

MINIMIZING THE WASTE DISPOSAL PROBLEM IN VEGETABLE PROCESSING,
W71-05755 05D

ADVECTION
PHYSICAL PROCESSES IN COASTAL AREAS,
W71-05792 05B

AERATION
ATMOSPHERIC GAS EXCHANGE IN THE MARINE ENVIRONMENT,
W71-05502 05G

AEROBIC TREATMENT OF FARM WASTES,
W71-05764 05D

AERIAL PHOTOGRAPHY
OCEAN OUTFALL DISPERSION,
W71-05521 05A

SURVEY AND PREDICTION OF POLLUTION IN THE OMUTA INDUSTRIAL HARBOUR,
W71-05548 05B

AEROBIC BACTERIA
WHIPPING THE MANURE PROBLEM,
W71-05422 05D

THE BEHAVIOUR OF BACTERIA IN THE PRESENCE OF PRODUCTS RELEASED BY MARINE PHYTOPLANKTON,
W71-05549 05C

AEROBIC CONDITIONS
MANURE TRANSFORMATIONS AND FATE OF DECOMPOSITION PRODUCTS IN WATER,
W71-05440 05B

AEROBIC DECOMPOSITION
A REPORT ON THREE MANURE COMPOSTING PLANTS,
W71-05739 05D

AEROBIC LAGOON
TREATMENT OF LIVESTOCK WASTE -- A LABORATORY STUDY,
W71-05430 05D

AEROBIC TREATMENT
CONTROL OF WATER POLLUTION FROM SOUTHWESTERN CATTLE FEEDLOTS,
W71-05412 05D

ANIMAL WASTES - A NATIONAL PROBLEM,
W71-05420 05G

AEROBIC DIGESTION (COMPOSTING) OF POULTRY MANURE,
W71-05427 05D

AEROBIC TREATMENT OF FARM WASTES,
W71-05764 05D

TREATMENT OF FARM WASTES,
W71-05766 05D

AEROSOLS
PROSPECTS FOR PHOTOSYNTHESIS FROM A.D. 1970 TO A.D. 2000,
W71-05475 02I

AGRICULTURAL ENGINEERING
MANAGEMENT OF AGRICULTURAL RESOURCES TO MINIMIZE POLLUTION OF NATURAL WATERS,
W71-05341 05G

AGRICULTURAL POLLUTION
AGRICULTURAL PRACTICES AND WATER QUALITY.
W71-05437 05B

AIR MASSES
A GENETIC APPROACH TO CLIMATIC CLASSIFICATION,
W71-05476 02B

CONVERGENCE ZONES IN SOUTHER CALIFORNIA,
W71-05710 02B

AIRLIFT SYSTEM
RECOVERY OF LARGE MARINE OIL SPILLS BY USE OF A VORTEX ASSISTED AIRLIFT SYSTEM,
W71-05526 05G

ALASKA

HYDRAULIC TESTING OF HOLE UAE-7H, AMCHITKA ISLAND, ALASKA,
W71-05371 08B

FLOOD FREQUENCY IN ALASKA,
W71-05378 02E

ALCOHOL
THE COURSE OF BIODEGRADATION OF ANIONIC DETERGENTS BY ANALYSES FOR CARBON, METHYLENE BLUE ACTIVE SUBSTANCE AND SULFATE ION,
W71-05653 05B

ALFALFA
THE EFFECT OF ANTITRANSPIRANT MATERIALS ON THE RADIATION BALANCE AND EVAPORTANSPIRATION IN AN IRRIGATED ALFALFA FIELD, ADDENDUM TO FINAL REPORT,
W71-05453 02D

ALGAE
A TECHNICAL ASSESSMENT OF CURRENT WATER QUALITY CONDITIONS AND FACTORS AFFECTING WATER QUALITY IN THE UPPER POTOMAC ESTUARY,
W71-05407 05B

PARAMETERS AFFECTING THE GROWTH OF ULVA LATISSIMA IN A POLLUTED ESTUARY,
W71-05500 05C

SOME ALGAE OF THE UPPER CUYAHOGA RIVER SYSTEM IN OHIO,
W71-05629 05A

UTILIZATION OF ALKOXYSILANES FOR REDUCTION OF THE ABUNDANCE OF PHYTOPLANKTON DURING 'BLOOMS' OF WATER BASINS (IN RUSSIAN),
W71-05719 05F

ALGAL BLOOMS
UTILIZATION OF ALKOXYSILANES FOR REDUCTION OF THE ABUNDANCE OF PHYTOPLANKTON DURING 'BLOOMS' OF WATER BASINS (IN RUSSIAN),
W71-05719 05F

ALKOXYSILANES
UTILIZATION OF ALKOXYSILANES FOR REDUCTION OF THE ABUNDANCE OF PHYTOPLANKTON DURING 'BLOOMS' OF WATER BASINS (IN RUSSIAN),
W71-05719 05F

ALLOCATION MODEL
A SPATIAL ALLOCATION MODEL FOR PROJECTED OUTDOOR RECREATION DEMAND A CASE STUDY OF THE CENTRAL UPSTATE NEW YORK REGION,
W71-05678 06D

ALLUVIAL SEDIMENTS
ION EXCHANGE AND RADIOCARBON DATING OF ALLUVIAL SEDIMENTS FROM THE LOWER PIO COPIAPO, CHILE,
W71-05601 02J

ALLUVIUM
ARTIFICIAL GROUNDWATER RECHARGE, WET WALNUT CREEK, CENTRAL KANSAS,
W71-05379 04B

HYDROLOGIC EFFECTS OF QUATERNARY SEDIMENTS ABOVE THE MARINE TERRACES IN THE GEORGIA COASTAL PLAIN,
W71-05580 02J

AMCHITKA ISLAND
FRESHWATER VERTEBRATE AND INVERTEBRATE ECOLOGY OF AMCHITKA ISLAND,
W71-05461 02E

AMMONIA NITROGEN
PARAMETERS AFFECTING THE GROWTH OF ULVA LATISSIMA IN A POLLUTED ESTUARY,
W71-05500 05C

ANAEROBIC BACTERIA
THE BEHAVIOUR OF BACTERIA IN THE PRESENCE OF PRODUCTS RELEASED BY MARINE PHYTOPLANKTON,
W71-05549 05C

ANAEROBIC CONDITIONS
OPTIMIZING LIPID BIOSTABILIZATION,
W71-05389 05D

MANURE TRANSFORMATIONS AND FATE OF DECOMPOSITION PRODUCTS IN WATER,
W71-05440 05B

ANAEROBIC DIGESTION
ANIMAL WASTES - A NATIONAL PROBLEM,
W71-05420 05G

TREATMENT OF LIVESTOCK WASTE -- A LABORATORY STUDY,
W71-05430 05D

ANAEROBIC TREATMENT OF FARM WASTES,
W71-05765 05D

ANAEROBIC LAGOONS
EFFLUENT QUALITY FROM ANAEROBIC LAGOONS TREATING FEEDLOT WASTES,
W71-05423 05D

ANAEROBICS
CHEMICAL AND BIOLOGICAL REACTIONS FROM LAGOONS USED FOR CATTLE,
W71-05742 05D

ANALOG MODELS
COMPARISON OF THE RESULTS OF LABORATORY TESTS WITH DATA OBTAINED BY FIELD OBSERVATIONS OF THE PERFORMANCE OF THE DRAINAGE SYSTEM IN THE SOIL MASSIF ON THE LEFT BANK OF THE BRATSK HYDROELECTRIC PLANT,
W71-05456 08D

ANALYSIS OF VARIANCE
THE EDAPHIC ADAPTATION OF SOME CLOSELY RELATED CLOVERS,
W71-05708 02I

ANALYTICAL TECHNIQUES
FIELD TESTING OF THE IAEA PORTABLE RADIOISOTOPE SEDIMENT-CONCENTRATION GAUGE,
W71-05352 07B

DETERMINATION OF ORGANIC- AND CARBONATE-CARBON IN FRESHWAT LAKE SEDIMENTS BY A MICROCOMBUSTION PROCEDURE,
W71-05399 05A

THE DETERMINATION OF LOW LEVELS OF COBALT-60 IN ENVIRONMENTAL WATERS BY LIQUID SCINTILLATION COUNTING,
W71-05590 05A

ANALYSIS OF TIME-VARIANT BEHAVIOR OF WATER CHEMISTRY,
W71-05705 02K

COMPLETE ADJUSTMENT METHOD FOR ANALYZING ARCH DAMS,
W71-05733 08A

ANIMAL DISEASES
DISEASE TRANSMISSION OF WATER-BORNE ORGANISMS OF ANIMAL ORIGIN,
W71-05441 05B

ANIMAL PATHOLOGY
DISEASE TRANSMISSION OF WATER-BORNE ORGANISMS OF ANIMAL ORIGIN,
W71-05441 05B

ANIMAL PRODUCTION
ANIMAL WASTES - A NATIONAL PROBLEM,
W71-05420 05G

ANIMAL SLURRY
THE PROBLEM OF DISPOSAL OF FARM WASTES, WITH PARTICULAR REFERENCE TO MAINTAINING SOIL FERTILITY,
W71-05750 05D

ANION EXCHANGE
ANALYSIS OF PLANTS, SOILS AND WATERS FOR NITRATE BY USING ION-SELECTIVE ELECTRODE,
W71-05636 05A

ANISOTROPY
COMPARISON OF THE RESULTS OF LABORATORY TESTS WITH DATA OBTAINED BY FIELD OBSERVATIONS OF THE PERFORMANCE OF THE DRAINAGE SYSTEM IN THE SOIL MASSIF ON THE LEFT BANK OF THE BRATSK HYDROELECTRIC PLANT,
W71-05456 08D

ANOMALOUS WATER
POLYWATER AND POLYPOLLUTANTS,
W71-05346 01B

ANOMALOUS WATER NOT POLYWATER,
W71-05599 01B

MICROWAVE DIELECTRIC MEASUREMENTS ON ANOMALOUS WATER,
W71-05602 01B

APICAL MORPHOGENESIS
THE INHIBITION OF FLOWERING BY WATER STRESS,
W71-05715 02I

APPARATUS
MINIMIZING THE WASTE DISPOSAL PROBLEM IN VEGETABLE PROCESSING,
W71-05755 05D

AQUACULTURE
PONDFISH FARMING IN NORWAY. SURVEY OF THE SITUATION TODAY, AND AN EVALUATION OF SOME PROFITABLE FACTORS,
W71-05669 08I

AQUATIC DRIFT
HARBOR DRIFT DISPOSAL,
W71-05514 05G

AQUATIC ENVIRONMENT
MONITORING OF THE MARINE ENVIRONMENT FOR WASTE COMPONENTS AND FOR EFFECTS OF THE INTRODUCED WASTES,
W71-05789 05A

AQUATIC LIFE
SOME BIOGEOCHEMICAL CONSIDERATIONS ON THE RADIOACTIVE CONTAMINATION OF MARINE BIOTA AND ENVIRONMENTS,
W71-05531 05A

ESTIMATION OF THE MAXIMUM DOSE TO MAN FROM THE CONTAMINATIO OF AN AQUATIC ECOSYSTEM WITH RADIONUCLIDES,
W71-05552 05C

BIOLOGICAL EFFECTS OF WASTE DISCHARGES ON COASTAL RECEIVING WATERS,
W71-05799 05C

AQUEDUCTS
OPTIMIZING THE LONG RANGE OPERATION OF THE CALIFORNIA AQUEDUCT BY INCREMENTAL DYNAMIC PROGRAMMING SIMULATION,
W71-05682 06A

UEOUS SOLUTIONS
DIFFUSIVITY OF OXYGEN IN AQUEOUS ELECTROLYTE SOLUTIONS,
W71-05454 01B

SALT EFFECTS IN AQUEOUS SOLUTIONS OF UREA,
W71-05618 02K

ANALYSIS OF FROZEN AQUEOUS SOLUTIONS BY SPARK SOURCE MASS SPECTROSCOPY,
W71-05650 05A

UIFER CHARACTERISTICS
GEOCHEMICAL HYDROLOGY OF THE GROUNDWATER IN BATON ROUGE, LOUISIANA,
W71-05348 02K

UIFER TESTS
HYDROGEOLOGIC DATA FOR THE UPPER HOUSATONIC RIVER BASIN, CONNECTICUT,
W71-05357 07C

UIFERS
GROUNDWATER RESOURCES IN THE EASTERN OSWEGO RIVER BASIN, NEW YORK,
W71-05374 02F

PROCEDURE FOR COMPUTING THE ELASTIC SEEPAGE REGIME IN CONFINED AQUIFERS,

SALTS
SALT EFFECTS IN AQUEOUS SOLUTIONS OF UREA,
W71-05618 02K

SAMPLE PREPARATION
WATER-CO SUB 2 EXCHANGE SET-UP FOR THE ROUTINE 18-OXYGEN ASSAY OF NATURAL WATERS,
W71-05640 05A

SAMPLING
SNOW SURVEY TECHNIQUES IN THE WAITAKI CATCHMENT, SOUTH CANTERBURY,
W71-05355 02C

PHOSPHATE DISTRIBUTION IN FOX AND WOLF RIVERS, WISCONSIN,
W71-05392 05C

MONTHLY VARIATION IN PHOSPHATE AND RELATED CHEMICALS FOUND IN THE SEDIMENT IN THE ISLAND AREA OF LAKE ERIE, 1967-68, WITH REFERENCE TO SAMPLES COLLECTED IN 1964, 1965, AND 1966,
W71-05571 05A

THE IDENTIFICATION AND MEASUREMENT OF CHLORINATED HYDROCARBON PESTICIDES IN SURFACE WATERS,
W71-05641 05A

A ROTATING SAMPLING ARM--AN AID TO AUTOMATIC ANALYSIS OR SAMPLING,
W71-05652 05A

SAND BARS
CHARACTERISTICS OF LAKE MICHIGAN BOTTOM PROFILES AND SEDIMENTS FROM LAKESIDE, MICHIGAN TO GARY, INDIANA,
W71-05568 02J

SANDBARS
THE GOLDSBORO RIDGE, AN ENIGMA,
W71-05578 02J

SANDS
HEAVY MINERALS IN BEACH AND STREAM SEDIMENTS AS INDICATORS OF SHORE PROCESSES BETWEEN MONTEREY AND LOS ANGELES, CALIFORNIA,
W71-05655 02J

SANITATION
COMMUNITY WATER SUPPLY IN DEVELOPING COUNTRIES A QUARTER-CENTURY OF UNITED STATES ASSISTANCE,
W71-05821 03B

SANTA BARBARA SPILLS
OFFSHORE-PETROLEUM AND THE ENVIRONMENT.
W71-05513 05G

SCANNING RADIOMETERS
OCEANOGRAPHIC APPLICATIONS OF REMOTE SENSING WITH PASSIVE MICROWAVE TECHNIQUES,
W71-05534 05A

SCENERY
A METHODOLOGY STUDY TO DEVELOP EVALUATION CRITERIA FOR WILD AND SCENIC RIVERS,
W71-05623 06B

SCENIC RIVERS
A METHODOLOGY STUDY TO DEVELOP EVALUATION CRITERIA FOR WILD AND SCENIC RIVERS,
W71-05623 06B

SCINTILLATION COUNTING
THE DETERMINATION OF LOW LEVELS OF COBALT-60 IN ENVIRONMENTAL WATERS BY LIQUID SCINTILLATION COUNTING,
W71-05590 05A

SCOTLAND
AGRICULTURE AND THE PREVENTION OF RIVER POLLUTION, AS EXPERIENCED IN THE WEST OF SCOTLAND,
W71-05421 05B

SCOUR
REMOVAL OF A SPHERICAL PARTICLE FROM A FLAT BED,
W71-05350 02J

SCRAPER
DISPOSAL OF DAIRY MANURE,
W71-05424 05D

SEA BREEZES
CONVERGENCE ZONES IN SOUTHER CALIFORNIA,
W71-05710 02B

SEA CURRENTS
INSTRUMENT TO MEASURE WEAK SEA CURRENTS,
W71-05522 05B

SEA ICE
MARINE HYDROCHEMISTRY,
W71-05666 02L

SEA WATER
TRANSPORT OF TRACE METALS TO THE ATLANTIC OCEAN BY THRE SOUTHEASTERN RIVERS,
W71-05579 05B

DIFFUSION COEFFICIENT OF SILICA IN SEAWATER,
W71-05595 02K

SEASHORES
ALLEN V WOOD (TITLE TO ACCRETIONS TO SEASHORE).
W71-05367 06E

SEASONAL
SEASONAL VARIATIONS IN INORGANIC PHYTOPLANKTON NUTRIENT THE INSHORE WATERS OF CARDIGAN BAY,
W71-05519 05B

SEDIMENT
NEW YORK CITY - A MAJOR SOURCE OF MARINE SEDIMENT,
W71-05790 05B

SEDIMENT BUDGETS
SEDIMENT BUDGETS ON A COMPARTMENTED LOW-TO-MODERATE ENE COAST IN NORTHWEST FLORIDA,
W71-05584 02J

SEDIMENT DISCHARGE
FIELD TESTING OF THE IAEA PORTABLE RADIOISOTOPE SEDIMEN CONCENTRATION GAUGE,
W71-05352 07B

SEDIMENT DISTRIBUTION
TRACING SAND MOVEMENT IN THE LITTORAL ZONE PROGRESS I RADIOISOTOPIC SAND TRACER (RIST) STUDY - JULY 1968-FEBR 1969,
W71-05657 02J

SEDIMENT ENTRAINMENT
REMOVAL OF A SPHERICAL PARTICLE FROM A FLAT BED,
W71-05350 02J

SEDIMENT TRACERS
TRACING SAND MOVEMENT IN THE LITTORAL ZONE PROGRESS I RADIOISOTOPIC SAND TRACER (RIST) STUDY - JULY 1968-FEBR 1969,
W71-05657 02J

SEDIMENT TRANSPORT
REMOVAL OF A SPHERICAL PARTICLE FROM A FLAT BED,
W71-05350 02J

ON THE PROBLEM OF DERIVING A SYSTEM OF EQUATIONS DESCRI THE MOTION OF WATER-SATURATED COHESIONLESS SOIL CONSIDE AS A MULTIPHASE MEDIUM,
W71-05458 08D

SEDIMENT BUDGETS ON A COMPARTMENTED LOW-TO-MODERATE ENE COAST IN NORTHWEST FLORIDA,
W71-05584 02J

MEASUREMENTS OF INCIPIENT MOTION OF SEDIMENT PARTICLES THE MARINE ENVIRONMENT,
W71-05585 02L

BOTTOM CURRENTS IN WILMINGTON SUBMARINE CANYON,
W71-05600 02L

HEAVY MINERALS IN BEACH AND STREAM SEDIMENTS AS INDICAT OF SHORE PROCESSES BETWEEN MONTEREY AND LOS ANGELES, CALIFORNIA,
W71-05655 02J

TRACING SAND MOVEMENT IN THE LITTORAL ZONE PROGRESS I RADIOISOTOPIC SAND TRACER (RIST) STUDY - JULY 1968-FEBR 1969,
W71-05657 02J

SEDIMENTARY GEOCHEMISTRY
GEOCHEMICAL CHARACTERISTICS OF LAKES MICHIGAN AND SUPER SEDIMENTS,
W71-05570 02J

SEDIMENTARY STRUCTURES
DEPOSITIONAL PROCESSES AND PRODUCTS IN THE DELTAIC ENVIRONMENT,
W71-05572 02L

STRATIGRAPHY AND HISTORY OF THE HOLOCENE SEDIMENTS IN T SABINE-HIGH ISLAND AREA, GULF OF MEXICO,
W71-05573 02L

THE MISSISSIPPI DELTA COMPLEX,
W71-05574 02L

HOLOCENE GUADALUPE DELTA OF TEXAS GULF COAST,
W71-05575 02L

THE GOLDSBORO RIDGE, AN ENIGMA,
W71-05578 02J

DIMENTATION
DEPOSITIONAL PROCESSES AND PRODUCTS IN THE DELTAIC ENVIRONMENT,
W71-05572 02L

STRATIGRAPHY AND HISTORY OF THE HOLOCENE SEDIMENTS IN THE SABINE-HIGH ISLAND AREA, GULF OF MEXICO,
W71-05573 02L

THE MISSISSIPPI DELTA COMPLEX,
W71-05574 02L

HOLOCENE GUADALUPE DELTA OF TEXAS GULF COAST,
W71-05575 02L

A COMPUTER SIMULATION MODEL OF SEDIMENTATION IN A SALT WEDGE ESTUARY,
W71-05586 02L

THE SEDIMENTARY FRAMEWORK OF MORETON BAY, QUEENSLAND,
W71-05615 02L

DIMENTS
A CONSIDERATION OF POLLEN, DIATOMS AND OTHER REMAINS IN POSTGLACIAL SEDIMENTS,
W71-05340 02J

DETERMINATION OF ORGANIC- AND CARBONATE-CARBON IN FRESHWATER LAKE SEDIMENTS BY A MICROCOMBUSTION PROCEDURE,
W71-05399 05A

SEVERN RIVER WATERSHED--SEDIMENT AND WASTE CONTROL.
W71-05493 06E

ARAGONITE INORGANIC PRECIPITATION IN A FRESHWATER LAKE,
W71-05597 02J

SEDIMENT-WATER NUTRIENT RELATIONSHIPS - PARTS 1 AND 2,
W71-05626 05B

CHEMICAL AND GEOCHEMICAL EFFECTS ON RECEIVING WATER,
W71-05796 05C

DIMENT-WATER INTERFACES
GEOCHEMICAL CHARACTERISTICS OF LAKES MICHIGAN AND SUPERIOR SEDIMENTS,
W71-05570 02J

EDLINGS
GROWTH OF ATRIPLEX HALIMUS L. IN SODIUM CHLORIDE SALINATED CULTURE SOLUTIONS AS AFFECTED BY THE RELATIVE HUMIDITY OF THE AIR,
W71-05714 02I

ISMIC STUDIES
PROFILES BETWEEN MANITOULIN ISLAND AND TOBERMORY (BRUCE PENINSULA),
W71-05564 02H

HIGH RESOLUTION REFLECTION SEISMIC SURVEY IN WESTERN LAKE ERIE,
W71-05567 02H

USBR VIBRATION TEST SYSTEM,
W71-05727 08A

IMPOUNDING OF MANICOUAGAN 5 RESERVOIRS AS POSSIBLE TRIGGER CAUSE OF LOCAL EARTHQUAKES,
W71-05735 08E

ISMIC SURVEY(LAKE ERIE)
HIGH RESOLUTION REFLECTION SEISMIC SURVEY IN WESTERN LAKE ERIE,
W71-05567 02H

LF-PURIFICATION
THE FATE OF INTESTINAL BACTERIA IN THE SEA,
W71-05527 05B

THE DIFFUSION OF BACTERIAL POLLUTION IN THE SEA,
W71-05547 05C

THE BEHAVIOUR OF BACTERIA IN THE PRESENCE OF PRODUCTS RELEASED BY MARINE PHYTOPLANKTON,
W71-05549 05C

NSITIVITY ANALYSIS
SENSITIVITY ANALYSIS A NECESSITY IN WATER PLANNING,
W71-05681 06A

PARATION TECHNIQUES
THE AUTOMATIC EXTRACTION, IDENTIFICATION AND DETERMINATION OF QUINIZARIN IN HYDROCARBON OILS,
W71-05633 05A

PTIC TANK
DISPOSAL OF DAIRY MANURE,
W71-05424 05D

PTIC TANKS
DISPOSAL OF WASTES FROM SWINE FEEDING FLOORS TO MINIMIZE STREAM POLLUTION,
W71-05738 05D

KELLY V KANSAS CITY BLDG AND LOAN ASS'N (LIABILITY TO ADJOINING LANDOWNER FOR OVERFLOW OF SEPTIC TANK).
W71-05772 06E

SEWAGE
PARAMETERS AFFECTING THE GROWTH OF ULVA LATISSIMA IN A POLLUTED ESTUARY,
W71-05500 05C

COMPUTER SIMULATION OF PHYTOPLANKTON GROWTH NEAR A MARINE SEWAGE OUTFALL,
W71-05506 05C

THE FATE OF INTESTINAL BACTERIA IN THE SEA,
W71-05527 05B

DISPERSION PHENOMENA IN COASTAL ENVIRONMENTS,
W71-05528 05B

CONGRESS PASSES WATER QUALITY IMPROVEMENT ACT OF 1970.
W71-05542 06E

THE DIFFUSION OF BACTERIAL POLLUTION IN THE SEA,
W71-05547 05C

SEWAGE BACTERIA
THE FATE OF INTESTINAL BACTERIA IN THE SEA,
W71-05527 05B

SEWAGE DISPOSAL
MARINE POLLUTION PROBLEMS IN JAMAICA,
W71-05349 05B

SEWAGE DISTRICTS
MUNICIPALITIES--SEWAGE DISPOSAL SYSTEMS--FINANCE, CONSTRUCTION AND OPERATION.
W71-05495 06E

SEWAGE EFFLUENTS
MARINE POLLUTION PROBLEMS IN JAMAICA,
W71-05349 05B

DIFFUSION OF SEWAGE EFFLUENT FROM AN OCEAN OUTFALL,
W71-05507 05B

SEWAGE SLUDGE
ELECTROOSMOTIC PUMPING FOR DEWATERING SEWAGE SLUDGE,
W71-05385 05D

SEWAGE TREATMENT
FAULKS V BOROUGH OF ALLENHURST (INSTALLATION OF SEWAGE TREATMENT PLANT ON PUBLIC ROAD EASEMENT).
W71-05403 06E

FUNGI ASSOCIATED WITH THE ACTIVATED-SLUDGE PROCESS OF SEWAGE TREATMENT AT THE LEBANON, OHIO, SEWAGE-TREATMENT PLANT,
W71-05624 05D

SEWERS AND SEWAGE TREATMENT,
W71-05754 05D

SEWERS
TOWN OF PALM BEACH V CITY OF WEST PALM BEACH (CITY'S POWER TO CONDEMN OTHER CITY'S PROPERTY FOR SEWAGE DISPOSAL PURPOSES).
W71-05498 06E

SHEAR LINES
CONVERGENCE ZONES IN SOUTHER CALIFORNIA,
W71-05710 02B

SHIPS
DELEGATION OF RESPONSIBILITY TO CARRY OUT CERTAIN PROVISIONS OF FEDERAL WATER POLLUTION CONTROL ACT.
W71-05490 06E

TOVALOP - ITS ORIGIN, DEVELOPMENTS, STATUS, AND OBJECTIVES,
W71-05532 05G

CONGRESS PASSES WATER QUALITY IMPROVEMENT ACT OF 1970.
W71-05542 06E

SHOOTS
EFFECTS OF ENVIRONMENT ON RELATIONS BETWEEN EXTENSION AND CAMBIAL GROWTH OF POPULUS EUPHRATICA OLIV.,
W71-05471 02I

SHORE EROSION CONTROL DISTRICTS
SHORE EROSION CONTROL (EROSION CONTROL DISTRICTS AND CONSTRUCTION LOANS).
W71-05492 06E

SHORE PROTECTION
SHORE EROSION CONTROL (EROSION CONTROL DISTRICTS AND CONSTRUCTION LOANS).
W71-05492 06E

EXPERIMENTAL DUNES OF THE TEXAS COAST,
W71-05660 08A

GEOMORPHOLOGY AND SEDIMENTS OF THE NEARSHORE CONTINENTAL SHELF MIAMI TO PALM BEACH, FLORIDA,
W71-05674 02J

SHORES
NEELD V DIXON (BOUNDARY OF RIPARIAN LAND WHERE SHORELINE DIFFERS FROM LEGAL DESCRIPTION).
W71-05393 06E

SHORT CIRCUITS
SHORT-CIRCUIT FORCES IN SWITCHGEAR INSTALLATIONS,
W71-05724 08C

SHRUBS
VEGETATION COMPARISONS BETWEEN THE MEDITERRANEAN CLIMATIC

AREAS OF CALIFORNIA AND CHILE,
W71-05470 02I

SILICA
DIFFUSION COEFFICIENT OF SILICA IN SEAWATER,
W71-05595 02K

SILICA DIFFUSION COEFFICIENT
DIFFUSION COEFFICIENT OF SILICA IN SEAWATER,
W71-05595 02K

SILTS
A TROPICAL EXAMPLE OF TOPSOIL ENRICHMENT BY FLOOD SILT,
W71-05358 02J

SIMULATION ANALYSIS
COMPUTER SIMULATION OF PHYTOPLANKTON GROWTH NEAR A MARINE SEWAGE OUTFALL,
W71-05506 05C

SIMULATION OF THE HYDROLOGIC CYCLE ON SMALL AGRICULTURAL WATERSHEDS BY DIGITAL TECHNIQUES,
W71-05557 06A

A COMPUTER SIMULATION MODEL OF SEDIMENTATION IN A SALT WEDGE ESTUARY,
W71-05586 02L

OPTIMIZING THE LONG RANGE OPERATION OF THE CALIFORNIA AQUEDUCT BY INCREMENTAL DYNAMIC PROGRAMMING SIMULATION,
W71-05682 06A

A COMPARATIVE STUDY OF CRITICAL DROUGHT SIMULATION,
W71-05683 02E

AN EXPERIMENT IN FINITE-DIFFERENCE WATERSHED MODELING,
W71-05701 02A

SINGLE-SHOT PHOTOGRAPHIC DRIFT INDICATOR
OIL FIELD TECHNIQUES USEFUL IN WATER WELL DRILLING,
W71-05696 08A

SKIMMERS
THE USE OF COATED FABRICS IN CONTAINMENT OF PETROLEUM,
W71-05530 05G

SLIDE DAMS
MECHANICS OF SLIDE DAMS,
W71-05729 08D

SLUDGE DIGESTION
DIGESTION TESTS OF LIVESTOCK WASTES,
W71-05416 05D

SLUDGE DISPOSAL
SLUDGE DUMPING IN THE THAMES ESTUARY,
W71-05342 05B

STATE OF THE ART REVIEW ON SLUDGE INCINERATION PRACTICE,
W71-05384 05D

W71-05384 05D

SLUDGE TREATMENT
STATE OF THE ART REVIEW ON SLUDGE INCINERATION PRACTICE,
W71-05384 05D

SLURRIES
ADVANCED WASTE WATER TREATMENT USING POWDERED ACTIVATED CARBON IN RECIRCULATING SLURRY CONTRACTOR-CLARIFIERS,
W71-05386 05D

DISPOSAL OF FARM EFFLUENT,
W71-05414 05D

THE PROBLEM OF DISPOSAL OF FARM WASTES, WITH PARTICULAR REFERENCE TO MAINTAINING SOIL FERTILITY,
W71-05750 05D

MINIMIZING THE WASTE PROBLEM WITH CATTLE,
W71-05758 05D

SLURRY
THIN SPREADING OF SLURRIED MANURES,
W71-05425 05D

SMALL WATERSHEDS
HYDROLOGY OF A SMALL RURAL WATERSHED UNDER SURBURBAN DEVELOPMENT,
W71-05770 04C

SNOW SURVEYS
SNOW SURVEY TECHNIQUES IN THE WAITAKI CATCHMENT, SOUTH CANTERBURY,
W71-05355 02C

STUDIES OF SNOW CHARACTERISTICS IN THE NORTH-EASTERN BEN OHAU MOUNTAINS, NEW ZEALAND,
W71-05362 02C

SNOWFALL
A HEATED ALPINE PRECIPITATION GAUGE,
W71-05363 07B

SNOWMELT
STUDIES OF SNOW CHARACTERISTICS IN THE NORTH-EASTERN BEN OHAU MOUNTAINS, NEW ZEALAND,
W71-05362 02C

SNOWPACKS
STUDIES OF SNOW CHARACTERISTICS IN THE NORTH-EASTERN BEN OHAU MOUNTAINS, NEW ZEALAND,
W71-05362 02C

SOCIAL ASPECTS
GENETIC PROBLEMS OF HOT DESERT POPULATIONS OF SIMPLE TECHNOLOGY,
W71-05481 02I

ANNUAL REPORT 1970.
W71-05663 06B

ACCESS--ITS EFFECT ON AREA GROWTH AND ENVIRONMENTAL QUALITY.
W71-05776 06B

SOCIAL CHANGE
THE DIFFERENTIAL EFFECTS OF ADVANCED COMMUNICATION, TRANSPORTATION, CENTRALIZATION, AND AFFLUENCE ON DISASTER RELIEF IN A KENTUCKY TOWN,
W71-05782 06E

SODIUM SULFATES
THE COURSE OF BIODEGRADATION OF ANIONIC DETERGENTS BY ANALYSES FOR CARBON, METHYLENE BLUE ACTIVE SUBSTANCE AND SULFATE ION,
W71-05653 05B

SOIL CHEMICAL PROPERTIES
EFFECT OF TRICKLE IRRIGATION INTERVALS ON DISTRIBUTION AND UTILIZATION OF SOIL MOISTURE IN A VINEYARD,
W71-05612 02G

SOIL CONSOLIDATION TESTS
CONSTANT LOADING RATE CONSOLIDATION TEST,
W71-05732 08D

SOIL MECHANICS
ON THE PROBLEM OF DERIVING A SYSTEM OF EQUATIONS DESCRIBING THE MOTION OF WATER-SATURATED COHESIONLESS SOIL CONSIDERED AS A MULTIPHASE MEDIUM,
W71-05458 08D

RHEOLOGICAL PROPERTIES AND BEARING CAPACITY OF FROZEN SOILS,
W71-05671 02C

SOIL MOISTURE
MOISTURE CHARACTERISTICS OF PENNSYLVANIA SOILS III. PARENT MATERIAL AND DRAINAGE RELATIONSHIPS,
W71-05343 02G

LOW-TEMPERATURE PHASES OF INTERFACIAL WATER IN CLAY-WATER SYSTEMS,
W71-05607 02G

NUMERICAL ANALYSIS OF SOIL-MOISTURE SYSTEMS,
W71-05621 02G

NET AND SOLAR RADIATION RELATIONS OVER IRRIGATED FIELD CROPS,
W71-05622 02D

A STUDY OF THE MECHANISMS AND SUPPRESSION OF EVAPORATION OF WATER FROM SOILS,
W71-05717 02D

SOIL STRUCTURE
MOISTURE RETENTION OF CULTIVATED AND PASTURED MOLLISOLS AND ALFISOLS,
W71-05611 02G

SOIL TESTS
CONSTANT LOADING RATE CONSOLIDATION TEST,
W71-05732 08D

SOIL TYPES
THE EDAPHIC ADAPTATION OF SOME CLOSELY RELATED CLOVERS,

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the EPA-Water Quality Office, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.

Supported by the Environmental Protection Agency in cooperation with WRSIC.

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Methods for chemical and biological identification and measurement of pollutants at the Analytical Quality Control Laboratory of the Water Quality Office of the Environmental Protection Agency.
- Coastal pollution at the Oceanic Research Institute.

Subject Fields

- NATURE OF WATER
- WATER CYCLE
- WATER SUPPLY AUGMENTATION AND CONSERVATION
- WATER QUANTITY MANAGEMENT AND CONTROL
- WATER QUALITY MANAGEMENT AND PROTECTION
- WATER RESOURCES PLANNING
- RESOURCES DATA
- ENGINEERING WORKS
- MANPOWER, GRANTS, AND FACILITIES
- SCIENTIFIC AND TECHNICAL INFORMATION

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 4, NUMBER 12
JUNE 15, 1971

W71-05836 -- W71-06455

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 4, NUMBER 12
JUNE 15, 1971

W71-05836 -- W71-06455

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency, Water Quality Office. A directory of the Centers appears on inside back cover.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ABSTRACT SOURCES

SELECTED WATER RESOURCES ABSTRACTS

01. NATURE OF WATER

1A. Properties

GRAPHIC DISSOLVED OXYGEN COMPUTATION,
Montana State Univ., Bozeman.
Neal Dixon.
Civil Engineering, Vol 41, No 3, p 60, March 1971. 1 p, 1 fig.

Descriptors: *Dissolved oxygen, *Dissolved oxygen analyzers, Methodology, Charts, Water quality, Water analysis, Surface waters, Salinity, Atmospheric pressure, Water temperature, Dissolved solids.
Identifiers: *Dissolved oxygen nomograph.

A convenient graph for dissolved oxygen computations was devised by coupling the chart with a nomograph relating dissolved oxygen concentration, saturation concentration, percent saturation, and percent deficit. This provides a rapid means of converting dissolved oxygen concentrations in milligrams per liter to percent saturation or deficit at any altitude, temperature, and dissolved solids concentration. (Woodard-USGS)

A HYDROLOGIC ANALYSIS OF THE NEW JERSEY PINE BARRENS REGION,
Geological Survey, Trenton, N. J.
Edward C. Rhodehamel.

New Jersey Division of Water Policy and Supply Water Resources Circular No 22, 1970. 35 p, 2 fig, 2 tab, 34 ref.

Descriptors: *Water resources, *Hydrology, *Hydrologic data, *Hydrologic aspects, *New Jersey, Surface waters, Groundwater, Precipitation (Atmospheric), Runoff, Streamflow, Aquifers, Aquifer characteristics, Water yield, Water balance, Specific capacity, Hydrologic budget, Water quality, Chemical analysis, Data collections, Evapotranspiration, Geology, Vegetation, Topography.
Identifiers: *Pine Barrens region (NJ).

Resources of the Pine Barrens region of south-central New Jersey (2,250 sq. mi. region in the Atlantic Coastal Plain underlain by the Cohansey Sand) is summarized. The long-term hydrologic budget can be stated as P—R..ET where: P, the average annual precipitation is 45 inches; R, the average annual stream runoff is 22.5 inches; and ET, the average annual evapotranspiration is 22.5 inches. Average annual evapotranspiration losses which total 2.41 bgd can be divided into: (1) interception losses--0.63 bgd, (2) evapotranspiration for undrained depressions--0.09 bgd, and (3) evapotranspiration from soil and groundwater--1.69 bgd. Average annual stream runoff which totals 2.41 bgd can be divided into (1) direct runoff--0.27 bgd and (2) base runoff or groundwater runoff--2.14 bgd. The flow of water within the regional flow system is calculated to be 70 mgd, or about 0.7 inch of water per year. Both ground and surface waters contain objectionable amounts of iron and at times color, and the pH values are in the acidic range. However, because of the low concentrations of total dissolved solids (25-50 mg/liter) treatment of the water for iron removal and pH adjustments will provide a water supply suitable for most purposes. SIMULATING SNOWMELT HYDROGRAPHS FOR THE FRASER RIVER SYSTEM,
British Columbia Univ., Vancouver. Dept. of Civil Engineering; and British Columbia Univ., Vancouver. Water Resources Group.
A. Pipes, M. C. Quick, and S. O. Russell.
Proceedings 38th Annual Meeting of Western Snow Conference, April 21-23, 1970, Victoria, British Columbia, Canada: Printed by Colorado State Univ, Fort Collins, p 91-97, 1970. 7 p, 4 fig, 4 ref.

Descriptors: *Simulation analysis, *Mathematical models, *Rainfall-runoff relationships, *Snowmelt, Synthetic hydrology, Evapotranspiration, Precipitation (Atmospheric), Heat budget, Topography, Temperature, Snow, Snowpacks, Streamflow forecasting, Water yield, Runoff forecasting.
Identifiers: *Runoff synthesis, Fraser River (B C).

The long term goal of a study at the University of British Columbia is to develop a simulation model of the Fraser River system for research and teaching purposes. The model can be used to estimate the consequences of storage reservoirs in the river system and simulate discharge from readily available meteorological data for purposes of flood forecasting and evaluating the impact of critical meteorological patterns. The study consists of two main phases: simulation of discharge from relatively small basins and routing of flows down the river channels. Techniques which are being used are described in the paper. MULTIVARIATE TECHNIQUES FOR SPECIFYING TREE-GROWTH AND CLIMATE RELATIONSHIPS AND FOR RECONSTRUCTING ANOMALIES IN PALEOCLIMATE,
Arizona Univ., Tucson. Tree-Ring Research Lab.; and Wisconsin Univ., Madison. Climatic Research Center; and Virginia Univ., Charlottesville. Dept. of Environmental Science.
Harold C. Fritts, Terence J. Blasing, Bruce P. Hayden, and John E. Kutzbach.
Final Contract Report for Department of Commerce, Environmental Science Services Administration - Weather Bureau, November 9, 1970. 48 p, 14 fig, 2 tab, 29 ref. ESSA Contract E-41-70 (N).

Descriptors: *Dendrochronology, *Paleoclimatology, Dating, Climatology, Ecology, Forests, Growth rates, Trees, Hydrology, Hydrogeology, Statistical methods, Regression analysis, Paleohydrology.
Identifiers: *Dendroclimatology.

Ring widths from trees on certain sites reflect climatic variation. Therefore, long time series derived from replicated and precisely dated ring-width chronologies may be utilized to extend climatic records into prehistoric times. Multivariate analyses of tree-ring chronologies from western North America are used to derive response functions from which one can ascertain what climatic information each ring-width chronology contains. In addition, multivariate analyses are utilized to calibrate a large number of ring-width chronologies of diverse response functions and from widely dispersed sites with a large number of regional climatic variables. A series of transfer functions are derived which allow estimates of anomalous climatic variation from tree-ring records. Reconstructions of anomalous variation in atmospheric circulation for portions of the northern hemisphere back to A.D. 1700 are obtained by applying the transfer functions to tree-ring data for time periods when ring data are available but climatic data are not. PACIFIC OCEAN INFLUENCE UPON CALIFORNIA RAINFALL,
California Univ., Los Angeles. Water Resources Center.
Jacob Bjerknes, and Charles B. Pyke.
Available from NTIS as PB-198 126, $3.00 in paper copy, $0.95 in microfiche. California University Water Resources Center Technical Completion Report W-254, November 30, 1970. 15 p, 10 fig. OWRR Project A-021-CAL (3).

Descriptors: *Climatology, *Synoptic analysis, Meteorology, Survey, Weather patterns, Air masses, Precipitation (Atmospheric), Storms, Weather, Rainfall.
Identifiers: *Western North America.

The climatic patterns of precipitation in the western United States and Baja California were examined in considerable detail. Of particular concern are the three prominent seasonal precipitation maxima: the winter maximum which occurs in all coastal and most interior sections, the summer maximum in the interior deserts of the southwestern United States and in Baja California, and the late spring maximum in the interior of the Pacific Northwest United States. The winter precipitation maximum is associated with extratropical cyclones of the north Pacific Ocean; and in the mean this maximum progresses generally southward along the west coast of the United States

with time, occurring in early December in northwestern Washington and in mid-February in portions of coastal southern California. This southward progression appears to be related to the general southward displacement of the mean upper tropospheric jet stream and the associated north Pacific storm track during the late fall and winter. The warm-season rainfall maxima which are observed in the interior portions of the western United States and Baja California appear to result primarily from convective activity occurring within warm, unstable air masses. DENSE NETWORK FOR RAPID MEASUREMENT OF RAINFALL RATE,
R. A. Semplak, and H. E. Keller.
Bell System Tech J, Vol 48, No 6, p 1745-1756, Jul-Aug 1969.

Descriptors: *Rain gages, *Design, *Data collections, *Rainfall disposition, *Instrumentation, *Measurement.

The design and operation of a dense rain gage system for obtaining statistical data on both the temporal and spatial distribution of heavy rainfall are discussed. This rain gage is a continuous, flow type with a response time of the order of one second. The system used for recording data on a magnetic tape is described, and typical computer-generated rain maps for large area storms and for localized showers are given.

For sale by Western Snow Conference, Mr. Robert T. Davis, Secretary, Rm. 360, United States Courthouse, Spokane, Wash. 99201 - Price $3.00. Proceedings 38th Annual Meeting of Western Snow Conference, April 21-23, 1970, Victoria, British Columbia, Canada: Printed by Colorado State Univ, Fort Collins, 1970. 107 p.

Descriptors: *Snowpacks, *Snowmelt, *Water yield, *Data collections, *Conferences, Telemetry, Data processing, Mathematical models, Digital computers, Streamflow forecasting, Runoff forecasting, Water management (Applied).
Identifiers: *Western Snow Conference.

This publication reports the available papers and formal discussions presented at the Thirty-Eighth Annual Meeting of the Western Snow Conference. The Conference convened in Victoria, British Columbia, on April 21-23, 1970. Topics discussed include snow management, snowpack instrumentation and telemetry, simulation of snowmelt runoff, snow loads (structural), streamflow forecasting, and automated flood warnings. (See also W71-06134 thru W71-06149) (Knapp-USGS)

SNOW AND RESERVOIR MANAGEMENT IN CANADA FOR THE COLUMBIA RIVER TREATY OPERATION,
British Columbia Hydro and Power Authority, Vancouver, Canada, Hydrology Branch.
W. H. Fisher, and U. Sporns.
Proceedings 38th Annual Meeting of Western Snow Conference, April 21-23, 1970, Victoria, British Columbia, Canada: Printed by Colorado State Univ, Fort Collins, p 1-6, 1970. 6 p, 3 fig, 5 ref.

Descriptors: *Reservoir operation, *International commissions, *International Joint Commission, *Columbia River, *Snow management, Runoff forecasting, Hydroelectric power, Snow surveys, Water conservation, Probability, Water storage.
Identifiers: *Columbia River Treaty.

Management of Columbia River Treaty storage reservoirs in Canada to increase hydroelectric power generation and flood control in the United States and Canada is described. Water management criteria are presented, consisting of operating rules, seasonal run-off forecasting procedures and short-term streamflow forecasting methods. The criteria, primarily derived by empirical methods, attempt to optimize the storage operation. Draft of the storage is governed by power generation requirements and seasonal run-off forecasts; refill of the storage is governed by seasonal run-off forecasts, short-term forecasts and power generation requirements. The seasonal run-off forecasts consider combined winter precipitation and snowpack water equivalent, spring and summer precipitation, antecedent precipitation and mean monthly maximum temperatures of the forecast period. Glacier melt is considered in the Mica drainage basin. (See also W71-06133) (Knapp-USGS)

THE DEVELOPMENT AND APPLICATION OF A HYDROLOGIC MODEL AS AN OPERATIONAL TOOL,
Sierra Hydrotechnology, Placerville, Calif., and California Cooperative Snow Surveys, Sacramento. Dept. of Water Resources.
Jack F. Hannaford, Richard H. Bush, and Raymond E. Barsch.
Proceedings 38th Annual Meeting of Western Snow Conference, April 21-23, 1970, Victoria, British Columbia, Canada: Printed by Colorado State Univ, Fort Collins, p 7-15, 1970. 9 p, 5 fig, 1 tab.

Descriptors: *Snowmelt, *Runoff forecasting, *Mathematical models, *California, Streamflow forecasting, Rainfall-runoff relationships, Hydrograph analysis, Base flow, Recession curves, Storm runoff, Operations research, Systems analysis, Flood forecasting.
Identifiers: *Kings River (Calif), San Joaquin Valley (Calif).

A runoff simulation technique was originally prepared for use on the American River and then applied to operational problems on the Kings River watershed during the record snowmelt runoff and floods of 1969. Hydrologic concepts and processes were modeled, basic data were collected to achieve simulation of these processes, and characteristic of the watershed are described. The modelin technique was used as a management tool to pro vide basic information for making operational deci sions in the Kings River watershed during 1969 (See also W71-06133) (Knapp-USGS)
W71-06135

DENSITIES OF PRAIRIE SNOWPACKS,
Saskatchewan Univ., Saskatoon. Dept. of Agricultural Engineering; and Saskatchewan Univ. Saskatoon. Dept. of Civil Engineering.
Don M. Gray, D. I. Norum, and G. E. Dyck.
Proceedings 38th Annual Meeting of Western Snow Conference, April 21-23, 1970, Victoria, British Columbia, Canada: Printed by Colorado State Univ, Fort Collins, p 24-30, 1970. 7 p, 4 fig, 1 tab, 4 ref.

Descriptors: *Snowpacks, *Water equivalent, *Grasslands, *Density, *Water storage, Density stratification, Instrumentation, Nuclear moisture meters, Water yield, Snow surveys.
Identifiers: *Prairie snowpacks.

During the winters of 1968 and 1969, several studies were undertaken related to snow in the highly-exposed Prairie Environment. The average density (during December-March) of freshly-fallen snow was approximately 0.045. Freshly-fallen snow may increase in density to a value of approximately 0.23 within 24 hours after the fall of the snow. This density is approximately equal to the average density which the pack maintains during the winter months. Water equivalent estimates may be made from measured depths using an assumed density of 0.23. A two probe gamma radiation apparatus was modified so that the source and detector travel at a rate of 15 inches per minute through the snow profile. When repeated measurements of a single profile were made the mean deviation in densities for point readings throughout the profile was 0.023. The difference between the average densities for the entire pack, on repeated measurements, was approximately 0.005. Measurements made on a notched plastic block show that the system is capable of accurately detecting changes in density due to layering, if the layers are greater than 1/2 inch thick. (See also W71-06133) (Knapp-USGS)
W71-06137

LABORATORY SIMULATION OF SNOWMELT,
British Columbia Univ., Vancouver. Dept. of Civil Engineering.
Michael C. Quick.
Supported by British Columbia Disaster Relief Fund. Proceedings 38th Annual Meeting of Western Snow Conference, April 21-23, 1970, Victoria, British Columbia, Canada: Printed by Colorado State Univ, Fort Collins, p 37-43, 1970. 7 p, 7 fig, 3 ref.

Descriptors: *Snowmelt, *Model studies, *Winds, *Laboratory tests, Heat budget, Turbulence, Mixing, Advection, Convection, Heat transfer, Albedo, Solar radiation.
Identifiers: *Wind tunnels, *Snowmelt simulation.

Snowmelt is the major input to high flow runoff in the Fraser River system, and it is necessary to have good understanding of factors effecting snowmelt before an adequate flow forecasting system can be constructed. To study the basic physics of snowmelt, a type of low speed wind tunnel was built in which temperature, humidity and radiation can be controlled, and melt rates of samples of snow can be measured. Results of some of these experiments are presented and the validity of such small scale tests to the calculation of, melt rates in the large scale natural situations is discussed. VARIATION OF GROUND SNOW LOADS IN BRITISH COLUMBIA,
National Research Council of Canada, Ottawa (Ontario). Div. of Building Research.

. A. Schaerer.
Proceedings 38th Annual Meeting of Western Snow Conference, April 21-23, 1970, Victoria, British Columbia, Canada: Printed by Colorado State Univ, Fort Collins, p 44-48, 1970. 5 p, 4 fig, 9 ef.

Descriptors: *Snowpacks, *Density, *Loads (Forces), Ice loads, Load distribution, Weight, Design, Design criteria, Building codes, Snow surveys, Data collections, Sampling, Topography, Altitude.
Identifiers: *British Columbia, *Snow loads.

he snow load used for the design of buildings vaes with geographical location, elevation and spect. In 1966 observations were initiated to obin information on the variation with elevation in ritish Columbia. This water equivalent of the ow on the ground was measured at sites having a andard exposure and at 400 feet intervals of evation on several mountains. The maximum ow load per winter is a second degree function of e elevation. Snowloads increase at a greater rate wet climate than in areas where snowfalls are all. (See also W71-06133) (Knapp-USGS)

r development of snow load data for Standard A- of the U.S.A. Standards Institute, it was decided t the best basis for snow load should be observan of actual weight of snow (water equivalent) in ference to the depth of snow multiplied by the sity. Since structures must withstand the exme load in any year, the annual extreme value ribution of water equivalent on the ground is ng employed. High elevation loads are a particu- problem and work looking toward solution of problem is discussed. Results on conversion n ground to roof and the effect of roof configuon are reviewed. ESTIMATES OF MONTHLY EVAPORATION LOSSES FROM THE GREAT LAKES 1950 TO 1968 BASED ON THE MASS TRANSFER TECHNIQUE,
Department of Transport, Toronto (Ontario). Meteorological Branch.
T. L. Richards, and J. G. Irbe.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 469-487, 1969. 19 p, 4 fig, 11 tab, 18 ref.

Descriptors: *Evaporation, *Great Lakes, *Mass transfer, Meteorology, Surveys, Water temperature, Reviews, Weather, Data collections, Meteorological data.
Identifiers: *Canada.

The Meteorological Service of Canada estimates, at the end of each month, the monthly evaporation losses from each of the Great Lakes bordering on Canada. These estimates are based on the mass transfer technique, using modified wind and vapor pressure data from shoreline climatological stations, and surface water temperature data from airborne radiation thermometer flights and ships' surveys. This paper presents a brief review of the technique and provides a record of monthly evaporation losses from each of the Lakes over a relatively long period. (See also W71-05561) (Knapp-USGS)

WATER RESOURCES OF THE HEBER-KAMAS-PARK CITY AREA, NORTH-CENTRAL UTAH,
Geological Survey, Salt Lake City, Utah.
C. H. Baker, Jr., and D. L. Peterson.
Utah Department of Natural Resources, Division of Water Rights, Technical Publication No 27, 1970. 79 p, 23 fig, 7 tab, 40 ref, append.

Descriptors: *Water resources, *Utah, Surface waters, Groundwater, Hydrologic budget, Streamflow, Aquifers, Water wells, Alluvium, Hydrogeology, Gravity studies, Data collections, Water quality, Hydrologic data, Hot springs.
Identifiers: Heber (Utah).

The Heber-Kamas-Park City area encompasses about 810 square miles in Wasatch and Summit Counties, in north-central Utah, and includes four mountain valleys--Heber Valley, Rhodes Valley, Parleys Park, and Round Valley--with most of the surrounding watersheds. On the boundary of the study area the average annual discharge of the Provo River for the 14-year period 1953-67 was 256,300 acre-feet per year. The average discharge of the Weber River was 110,000 acre-feet per year. The consolidated rocks of the Wasatch Range and Uinta Mountains contain large quantities of groundwater, mostly in fractures and solution openings, and numerous springs discharge water from the consolidated rocks. Most wells yield only small supplies of water from the consolidated rocks. The primary permeability of the rocks is low, and wells can produce large yields only if they intersect fractures and solution openings. Most of the wells in the area derive water from the unconsolidated alluvial fill in the four valleys. The aquifer characteristics of the unconsolidated material in the four valleys are generally similar. The transmissivity ranges from 6,700 to 20,000 cubic feet per day per foot in Heber Valley and probably is less in the other valleys. The specific yield is estimated to be 12-15 percent. In Heber Valley the average annual recharge and discharge is calculated as about 86,000 acre-feet of water. An estimated 280,000 acre-feet of water could be recovered by dewatering the upper 100 feet of the aquifer in the unconsolidated deposits in Heber Valley, 310,000 acre-feet could be recovered by dewatering the upper 100 feet in Rhodes Valley, and about 80,000 acre-feet could be recovered by dewatering the unconsolidated deposits in Parleys Park. The water is of good quality for most uses. (Knapp-USGS)

HORIZONTAL TRANSPORT IN A ROTATING BASIN OF PARABOLIC DEPTH PROFILE,
Northwestern Univ., Evanston, Ill.
G. E. Birchfield.
Journal of Geophysical Research, Vol 72, No 24, p 6155-6163, December 15, 1967. 9 p, 3 fig, 5 ref. NSF Grant GP-3659.

Descriptors: *Rotational flow, *Flow profiles, *Surface waters, *Currents (Water), *Mathematical models, Basins, Rotations, Vortices, Eddies, Stress, Surface tension, Viscosity, Volocity, Depth, Boundaries (Surfaces), Mathematical studies, Equations, Diversion, Water circulation.
Identifiers: Horizontal transport (Water currents).

Horizontal transports in a rotating parabolic basin are found for three elementary steady stress fields. For a uniform stress, the circulation consists of two vortices so arranged that the inshore transport is more or less in the direction of the surface stress, with a return flow in the interior. For a stress with constant curl, the interior transport is a large symmetric vortex, with possibly a weak countercurrent near the shore; for a stress with constant divergence a weak vortex occurs in the interior, with weak countercurrents occurring near shore. For a combined surface stress, the transport in the interior is dominated by the curl component; near shore the uniform stress component may be equally important. (Woodard-USGS)

WIND-DRIVEN CURRENTS IN A LONG ROTATING CHANNEL,
Northwestern Univ., Evanston, Ill. Technological Inst.
G. E. Birchfield.
Tellus, Vol 19, No 2, p 243-249, 1967. 7 p, 1 fig, 1 tab. NSF Grant GP-3659.

Descriptors: *Currents (Water), *Surface waters, *Channel flow, *Model studies, Winds, Wind velocity, Boundaries (Surfaces), Rotational flow, Channel morphology, Stress, Water circulation, Mathematical studies, Equations, Steady flow, Surface tension, Flow profiles, Viscosity, Flow rates.
Identifiers: *Wind-driven water currents.

Boundary-layer type solutions are obtained for currents generated in a homogeneous fluid in a long rotating channel by a steady wind stress acting along or across the channel. Included are viscous wall boundary layers which arise necessarily from secondary circulations transverse to the axis of the channel, and from no-slip conditions at the wall. In order to satisfactorily incorporate the vertical structure a very simple model is used. Since the wind stress is assumed independent of the coordinate along the channel, the motions are also assumed two dimensional, with the one exception that a constant pressure gradient along the channel is permitted as a special case. The horizontal scale is such that the rotation of the channel may be taken as a constant; the fluid is homogeneous. The currents produced by the constant pressure gradient along the channel represent a counterclockwise circulation. A case of special interest is that of uniform stress along the channel. (Woodard-USGS)

STABILITY OF ROCK SLOPES--GRAPHICAL METHODS,
Coyne et Bellier, Paris (France).
P. Londe, G. Vigier, and R. Vormeringer
Proc Amer Soc Civ Eng, J Soil Mech Found Div, Vol 96, No SM4, p 1411-1434, July 1970. 24 p, 14 fig, 1 tab, 9 ref, 3 append.

Descriptors: Rock mechanics, *Rocks, Sliding, *Slope stability, Soil mechanics, *Stability analysis, *Graphical analysis, Diagrams, Dams, Abutments, Computer programs, Safety factors, Shear strength, Uplift pressure, Equilibrium, Analytical techniques, Methodology, Mapping, Foreign design practices, *Rock slope stability, *In situ rock.
Identifiers: France.

Three practical procedures for constructing simple diagrams for 3-dimensional study of rock slope stability are proposed. The diagrams show simultaneously all possibilities of limit equilibrium of a tetrahedral rock volume and allow detection and appreciation of the main problems of stability. In most cases, a glance at the diagram reveals the vital parameters that should be checked by measurement or controlled by special arrangements of design. Geometrical methods (stereographic or central projection of figures drawn on a sphere) or calculations made by electronic computer can be used for diagram construction. Analysis of an arch dam abutment by diagrams constructed using each of the 3 methods is presented. (USBR)

PRELIMINARY REPORT ON THE WATER RESOURCES OF THE WAILUKU AREA,
Geological Survey, Honolulu, Hawaii.
George Yamanaga, and C. J. Huxel, Jr.
Hawaii Division of Water and Land Development Circular C61, December 1970. 43 p, 9 fig, 7 tab, 9 ref.

Descriptors: *Water resources, *Groundwater, *Surface waters, *Hawaii, Evaluation, Hydrologic data, Data collections, Aquifers, Geology, Streamflow, Runoff, Water yield, Water quality, Aquifer characteristics, Rainfall, Water resources development, Withdrawal, Consumptive use, Specific capacity.
Identifiers: *Maui (Hawaii).

The occurrence of groundwater and surface water in the Wailuku, Hawaii area and what is known of the quantity and quality of water available for development is summarized. The area studied is about 75 square miles and is mainly the part of the Wailuki District which lies in West Maui. Drainage basins range in character from the dry gulches south of Waikapu to the deep valleys between Waikapu and Waihee. All perennial streams in the area except Makamakaole Stream derive their ba flows from water draining from high-level, dik held groundwater bodies lying within the We Maui Mountain. The largest sources of water a the Waihee River and Iao Stream. Waikapu ar Waiehu Streams also supply significant amounts water for irrigation. Groundwater occurs as hig level, dike-held water within the mountain mass, as basal water and as perched water. The mo promising source of additional water for use duri drought periods apperas to be a basla-water body the area between Waikapu and Waihee Valley (Woodard-USGS)

HYDROLOGIC INVENTORY OF THE UTA LAKE DRAINAGE AREA,
Utah Water Research Lab., Logan.
M. Leon Hyatt, Gaylord U. Skogerboe, Frank W. Haws, and Lloyd H. Austin.
Report PR WG 40-3, Utah Water Researc Laboratory, November 1969. 138 p. 60 fig, 43 ta 45 ref.

Descriptors: *Hydrologic data, *Hydrolog budget, *Water utilization, *Utah, *Maps, Histor Economics, Geology, Streamflow, Groundwate Water quality, Data collections, Regional analyses
Identifiers: *Utah Lake, *State water plans.

To facilitate the development of statewide plan water development for Utah, this comprehensiv report describing the Utah Lake Drainage Are was undertaken. This area, also called the Upp Jordan Hydrologic Basin is located in north-centr Utah. The physiography, topography, geology an profiles of stream beds are discussed or di grammed. Basic data are tabulated, includin precipitation, temperature, streamflow, historic runoff, principal groundwater basins, consumptiv use, water quality information, water transporta tion, and water storage. The area is divided int eighteen subareas, and water budget diagrams an analyses are presented for each subarea as well as budget for the entire area. The principal use water in the Utah Lake Drainage area is for agricu ture; and beef- and dairy-cattle production, and th raising of small grains and alfalfa, are the most im portant agricultural uses. This report is supple mented with many detailed figures and table (Yensen-Arizona)

HYDROLOGIC INVENTORY OF THE UINTA STUDY UNIT,
Utah Water Research Lab., Logan.
Lloyd H. Austin, and Gaylord V. Skogerboe.
Report PRWG 40-5, Utah Water Research Labora tory, March 1970. 182 p. 126 fig, 84 tab, 65 ref.

Descriptors: *Hydrologic data, *Utah, *Hydrologi budget, *Maps, *Water utilization, Regiona analyses, Data collections, Water quality, Ground water, Streamflow, Economics, Geology, History Water policy, Water resources development.
Identifiers: *Uintah Basin, *Green River, *Stat water plans.

The Uintah Basin hydrologic area is a large district in the north-eastern corner of Utah. Of grea economic importance is the oil-bearing shale of th Green River Formation. However, agriculture i the greatest water-consumer, the most importan agricultural products being beef, alfalfa, wool, an dairy products. This report was undertaken t facilitate development of a comprehensive stat water plan. The geology, history, economy, and cli mate are outlined, and the various formations af fecting groundwater flow and storage are discussed. Basic data concerning temperature precipitation, streamflow, consumptive use, and water quality are tabulated. Annual and monthly water budgets for the fifty-six subareas are presented and analyzed. Many maps, tables, and figures supplement and document this report. (Yensen-Arizona)

Available from Utah Water Research Laboratory, Logan, Utah $2.50. Report PRWG 40-6, Utah Water Research Laboratory, August 1970. 131 p. 37 fig, 39 tab, 56 ref.

Descriptors: *Hydrologic data, *Utah, *Hydrologic budget, *Maps, *Water utilization, Data collections, Water quality, Groundwater, Streamflow, Regional analyses, Economics, History, Geology, Water policy, Water resources development.
Identifiers: *Weber River, *State water plans.

This report was undertaken as part of an effort to compile a hydrologic inventory of the state, to be used in developing a comprehensive water plan for the state of Utah. The Weber River Study Unit is located in this area. Alfalfa, grain, corn, and orchard crops are grown. Basic features of the geology, history, economy, and climate are outlined. Information on temperature, precipitation, streamflow, water quality, and groundwater has been collected and tabulated. Monthly and annual water budgets for each of the nine subareas of this region are given and analyzed, along with a summary of the water budget program. Many figures, maps, and tables supplement this report. (Yensen-Arizona)

HYDROLOGY OF LIMESTONE TERRANES, PHOTOGEOLOGIC INVESTIGATIONS,
Geological Survey of Alabama University.
John L. Sonderegger.
Available from NTIS as PB-198 043, $3.00 in paper copy, $0.95 in microfiche. Alabama Geological Survey Bulletin 94, Part C, 1970. 27 p, 9 fig, 5 plate, 33 ref. OWRR Project B-007-ALA (4).

Descriptors: *Hydrogeology, *Remote sensing, Carbonate rocks, *Aerial photography, Alabama, Karst, Aquifers, Fractures (Geology), Surveys, Terrain analysis, Groundwater movement, Porosity, Permeability, Infrared radiation.
Identifiers: Limestone County (Ala).

Panchromatic, color, and infrared films were used to locate fracture traces as an aid to the interpretation of the occurrence and movement of groundwater in a limestone area in Alabama. Air photography using color and infrared films resulted in greater interpreter confidence and showed correlation with geologic structure. Wells drilled along fracture traces yielded substantially more water than the average of the randomly located wells. The thickness of the residuum had no noticeable control over the fracture-trace concentration. Previous models explaining the relationship between fracture traces and solution activity dealt with a single homogeneous limestone aquifer. In this area, two limestone aquifers separated by an aquiclude produce two different lithologic units on which solutional features that are reflected by fracture traces are developed. (Knapp-USGS)

RECONNAISSANCE INVESTIGATION OF THE SUBSIDENCE OF VENICE AND SUGGESTED STEPS TOWARD ITS CONTROL,
Geological Survey, Sacramento, Calif.
J. F. Poland, and L. J. Mostertman.
United Nations Educational Scientific and Cultural Organization Report, Paris, 1969. 24 p, 10 fig, 1 tab.

Descriptors: *Land subsidence, *Subsidence, *Withdrawal, *Aquifers, Water levels, Reviews, Surveys, Alluvium, Coastal plains, Islands, Beaches, Groundwater, Water table.
Identifiers: *Venice (Italy).

The main cause for the recent increase of the rate of subsidence of Venice (Italy) is the withdrawal of groundwater from the aquifers in the Venetian plain. In order to investigate further the nature, rate and causes of the subsidence and in order to identify which strata contribute to this phenomenon a program of geophysical surveys and drillings, followed by field tests and laboratory analysis, is proposed. These investigations are recommended to be conducted in such a way that they also furnish data necessary for study of the feasibility of remedial measures. A system of collection of available data and the use of a mathematical model are also recommended. Immediate legislative action to control groundwater discharge is considered to be necessary. Available from NTIS as PB-198 051, $3.00 in paper copy, $0.95 in microfiche. Ohio Water Resources Center Project Completion Report No 331X, January 12, 1971. 21 p, 4 fig, 11 ref. OWRR Project B-006-OHIO (2).

Descriptors: *Aquifers, *Drawdown, *Numerical analysis, Drainage, Zone of saturation, Hydraulic gradient, Pumping, Groundwater, Boundary processes, Wells, Seepage, Computer.
Identifiers: *Unconfined aquifer, Pumped wells, Vertical flow, Seepage surface, Free surface, Finite difference method.

The purpose is to present methods for utilizing numerical analysis and computer operations to solve problems of drawdown around a pumped well in an unconfined aquifer. The procedure is that of solving the basic flow equations for specified boundary conditions. The method takes into account the properties of the unsaturated portion of the aquifer and the contributions of vertical flow. The computer can give simultaneous solutions for flow in the saturated and unsaturated zone. The surface of seepage can also be included in the analysis. Although this report deals with flow into wells, the procedure is applicable to a variety of water flow problems. (Rackoff-Ohio State)

VENICE IS SINKING INTO THE SEA,
Electroconsult, Milan (Italy).
Carlo Berghinz.
Civil Engineering, Vol 41, No 3, p 67-71, March 1971. 5 p, 1 map, 3 photo, 2 tab.

Descriptors: *Land subsidence, *Submergence, *Tidal waters, *Cities, *Floods, Groundwater, Drawdown, Industries, Construction, Lagoons, Planning, Evaluation, Canals, Buildings.
Identifiers: *Venice (Italy).

Venice, Italy was founded 1,400 years ago on low land in the middle of a shallow lagoon 35 miles long and 6 miles wide. Today, storm surges of water frequently flood the low-lying city, damaging her historic buildings. What is worse, the city is subsiding, largely due to groundwater drawdown and nearby industrial construction. Sea barriers have been proposed; they would create a new problem because Venice has no sewerage system and so up to now needs the tidal flush. As interim steps, the city's artesian wells are being progressively closed, and no oil or gas drilling is permitted. Many more steps must be taken to save the city. (Woodard-USGS)
W71-06120

TURBULENT DISPERSION IN POROUS MATERIALS AS MODELED BY A MIXING CELL WITH STAGNANT ZONE,
California State Coll., Long Beach; and California Univ., Los Angeles.
C. R. Kyle, and R. L. Perrine.
Society of Petroleum Engineers Journal, Vol 11, No 1, p 57-62, March 1971. 6 p, 3 fig, 14 ref.

Descriptors: *Dispersion, *Mixing, *Porous media, *Turbulent flow, Groundwater movement, Mathematical models, Theoretical analysis, Diffusion, Turbulence.
Identifiers: *Turbulent dispersion.

A simple theoretical analysis is given of dispersion in rapid flow through porous materials. The analytical model considers a pore structure which acts like a sequence of mixing cells, each coupled with a stagnant zone. Computed results compare very favorably with experimental observations on flow through a staggered matrix of cylinders. This flow is shown to behave like packed beds of spheres with corresponding properties. Agreement requires that values for some theoretical parameters be fitted from the data. The values required for these parameters are reasonable. Development of this approach could be useful for a number of related problems. (Knapp-USGS)

AVAILABILITY OF GROUNDWATER IN CHARLES COUNTY, MARYLAND,
Maryland Geological Survey, Baltimore.
Turbit H. Slaughter, E. G. Otton, and Charles P. Laughlin.
Maryland Geological Survey Bulletin 30, 1968. 100 p, 31 fig, 14 tab, 23 ref.

Descriptors: *Water resources development, *Groundwater, *Maryland, Water supply, Water yield, Water wells, Water quality, Groundwater movement, Aquifers, Urbanization, Hydrogeology, Hydrologic data, Data collections.
Identifiers: *Charles County (Md).

Charles County covers an area of 457 square miles of Maryland. On the average it receives about 46 inches of precipitation. The average annual temperature is about 56 degrees F. The estimated use of groundwater during 1962 was about 3.8 mgd. The largest single user of groundwater was the U. S. Naval Propellant Plant at Indian Head. The county is underlain by a wedge-shaped mass of sedimentary strata ranging in thickness from 600 to 2,000 feet. Several important aquifers are present throughout the county; based on rough estimates, these aquifers may be capable of yielding at least 55 mgd to properly spaced drilled and dug wells. About 3 mgd of groundwater can be obtained in the area of lowest economic and population growth potential and 16 mgd in the area of greatest potential. However, proper management of the groundwater resource will be necessary. The Waldorf area in the north-central part of the county appears to be most favorable for the development of large additional supplies. The chemical quality of the groundwater is satisfactory for most uses, although, locally, treatment for iron removal may be required. (Knapp-USGS)

AVAILABILITY OF GROUNDWATER IN DECATUR COUNTY, IOWA,
Geological Survey, Iowa City, Iowa.
J. W. Cagle, and W. L. Steinhilber.
Iowa Geological Survey Water Atlas No 2, 1967. 27 p, 9 fig, 3 tab.

Descriptors: *Water resources, *Groundwater, *Hydrologic data, *Data collections, *Iowa, Geology, Aquifers, Water wells, Drill holes, Water quality, Water yield, Chemical analysis, Hydrogeology, Water levels, Water sources, Pumping.
Identifiers: *Well data, *Test holes, *Decatur County (Iowa).

Groundwater information is presented to help solve the supply problems of some water users in Decatur County, Iowa. The information includes the location, definition, and estimated potential yields of the water-bearing materials in the unconsolidated deposits and the uppermost bedrock; an evaluation of the general occurrence and availability of water from bedrock sources; and a determination of the chemical quality of water from groundwater sources. Decatur County has an area of 530 sq mi and, according to the 1960 census, has a population of 10,539. About 55% of the population live on farms or in small communities where the water supply is obtained from private wells, ponds and cisterns. The remainder of the residents live in towns that have municipal water systems. Small-to-moderate supplies of water are available for development from the unconsolidated deposits in the county. Yields of several hundred gpm per well can be obtained from the deeper bedrock strata at about 2,600 to 2,700 feet in depth. Bedrock strata of shallower depths are capable of yielding 80 to 100 gpm per well. (Woodard-USGS)

SEEPAGE FACE EFFECTS IN UNSTEADY GROUNDWATER FLOW,
Wisconsin Univ., Madison. Water Resources Center; and Wisconsin Univ., Madison. Dept. of Civil Engineering.
Willard A. Murray.
Ph D Thesis. Wisconsin Water Resources Center, Madison, 1970. 143 p, 21 fig, 10 tab, 56 ref. OWRR Project B-021-WIS (1).

Descriptors: *Seepage, *Free surface, *Dimensional analysis, *Aquifer, *Ditches, Streams, *Flow, Water table, Drawdown, Groundwater.
Identifiers: *Saturated region, Fourier Analysis, Outflow face.

This study deals with the effect of the seepage face on the location of the free surface in a two-dimensional unconfined aquifer adjacent to a ditch or stream. The analysis is restricted to considering flow only in the saturated region below the water table; unsaturated flow effects are neglected. Theoretical solutions were obtained for steady state conditions and for the transient case of instantaneous drawdown by using potential theory and standard Fourier methods. The steady state solution is a corrected form of that presented by Kirkham (1964), which was found to contain a flaw. The transient solution involves a simple extention of the steady state solution and reduces to the latter for large time. Both solutions are presented in infinite series form. For the steady state, theoretical results indicate that the simple Dupuit parabola will give entirely satisfactory predictions of free surface locations for moderate drawdowns. For the transient case, the derived solutions indicate that the seepage face length decays exponentially. Furthermore, the transient solution including the effect of the seepage face shows a marked difference from the simplified potential solution in which the seepage face effect is neglected, particularly for small times and for locations near the outflow face. Experiments were conducted using a Hele-Shaw viscous flow model to verify the theoretical predictions.

Vegetable crops, Stabilization, Water management (Applied), Farm management, Chernozem, Seasonal, Thawing, Temperature, Fourier analysis, Laplaces equation.
Identifiers: Field conditions, Heat-conductivity equation, Yakutsk (U.S.S.R.), U.S.S.R., Irrigation status, Irrigated crops.

Crop yields, plant growth and development are determined by thermal-, water-, and nutrient-soil regimes. Thermal-regime study is important to crops, especially in permafrost regions. Potato- and other vegetable-irrigation studies on Meadow-Chernozem soil near Yakutsk indicate that permafrost underlies a thawed layer in warm seasons. The main parameters are heat flow, thawing and temperature regime. The Fourier heat-conductivity equation is applied to field conditions. Soil moisture, or irrigation status, effect the Fourier variables. Irrigation is an effective way of regulating thermal regimes, as to provides soil moisture and temperature stability. Results of 4 other Russian studies are outlined. (Popkin - Arizona)

James E. Garton.
Available from NTIS as PB-198 234, $3.00 in paper copy, $0.95 in microfiche. Completion Report, Oklahoma Water Resources Research Institute, Stillwater, (1970). 20 p, 5 tab, 4 fig, 8 ref, append. OWRR Project A-006 OKLA (2).

Descriptors: *Overland flow, *Mannings equation, Uniform flow, Simulation analysis, Synthetic hydrology, *Flow resistance, Flow rates, Flow, Hydraulics.
Identifiers: *Simulated vegetation.

Information is sparse on the retardance of flow through upright stems of vegetation. Studies were conducted on a smooth flume in which cylindrical retardance elements were inserted at various regular spacings. The effects of pattern of spacing, diameter of elements, spacing of elements, slope and flow rate on Manning's coefficient were determined. Linear, quadratic and logarithmic response surfaces were calculated. Multiple correlation coefficients usually greater than 0.97 were obtained. The linear multi-variable model and the exponential model gave comparable standard deviations. A quadratic model gave slightly improved estimates, but it results in a more complex equation with eleven coefficients.

Identifiers: *Clays, Soil water, *Soil water, Motion, *Partial differential equations, *Numerical integration, Computer programs, Foundations, Roads, Mathematical prediction, Permeability, Bridge foundations, GCHPIP1 computer program, Crank-Nicolson method, FLOPIP2 computer program.

This report describes two computer programs for determining changing moisture distribution with time. Program FLOPIP2 is arranged to work one-dimensional problems and computer Program GCHPIP1 solves moisture distribution problems in two dimensions. The equation governing the flow of moisture is a concentration-dependent, parabolic, partial differential equation which is solved numerically using the implicit Crank-Nicolson method of marching forward in time. Although it is stable in one-dimensional problems, the Crank-Nicolson method can become unstable in two-dimensional problems, depending upon the relative size of the components of the permeability tensor. This rare form of instability is predicted theoretically and observed in one of the example problems. Example problems are worked to demonstrate the capabilities and breadth of application of the computer programs and to prove the validity of the approach. The one-dimensional example are concerned with matching measured field data and with presenting the results of a parameter study of various suction and permeability factors. The field data can be duplicated to within very close tolerances. The two-dimensional example problems are arranged to demonstrate the versatility of computer Program GCHPIP1. Problems solved include a two-dimensional consolidation problem, ponding problems, and a problem of predicting moisture distribution within a concrete highway bridge girder.

LIMNOLOGY OF ZUNI SALT LAKE, NEW MEXICO,
Minnesota Univ., Minneapolis. Limnological Research Center.
J. P. Bradbury.
Geological Society of America Bulletin, Vol 82, No 2, p 379-398, February 1971. 20 p, 12 fig, 1 tab, 27 ref.

Descriptors: *Limnology, *Saline water, *Brines, *New Mexico, *Saline lakes, Salts, Sedimentation, Sediments, Salinity, Mixing, Thermal stratification, Density stratification, Chemical precipitation, Algae, Evaporation, Calcite, Gypsum, Water balance, Runoff.
Identifiers: Zuni Salt Lake (N Mex).

Zuni Salt Lake is a shallow saline lake in a maar in west-central New Mexico. The basin was formed during the late Pleistocene when volcanic and phreatic explosions punctured Paleozoic and Mesozoic strata. The lake is supported by runoff and saline springs (specific gravity 1.010 to 1.130), which rise along fractures in the volcanic conduits underlying the maar and apparently dissolve salt from the Permian Supai Formation. Dominant organisms of Zuni Salt Lake and the Cinder Cone Pool are Artemia salina and Hydropyrus hians. The bottom of the pool is covered with a blue-green algal mat of Anacystis sp. Sediments in Zuni Salt Lake consist of salt crusts (halite, calcite, and gypsum) inter-bedded with layers of clay and organic matter. The sediments of the pool are watery sapropel, algal material, calcite, and gypsum. Fluctuations of the chemistry, physics, and biology of these aquatic environments are extreme because of sporadic but torrential rainfall entering the shallow lakes in late summer and early fall. THE GENERATION OF LANGMUIR CIRCULATIONS BY THE EDDY PRESSURE OF SURFACE WAVES,
Maryland Univ., College Park. Inst. for Fluid Dynamics and Applied Mathematics; and Maryland Univ., College Park. Graduate Meteorology Program.
Alan J. Faller.
Limnology and Oceanography, Vol 14, No 4, p 504-513, July 1969. 10 p, 3 fig, 12 ref. NSF Grant GA-4388.

Descriptors: *Water circulation, *Lakes, *Oceans, *Mixing, *Waves (Water), Thermal stratification, Winds, Convection, Heat transfer, Limnology, Mass transfer, Currents (Water), Model studies, Hydraulic models.
Identifiers: *Langmuir circulation.

The Langmuir circulations in lakes and oceans are shown, by theory and by the extension of laboratory experiments, to be the result of wave action. Specifically, the exponential decay of vertical oscillations that are a maximum near the free surface gives rise to an instability that is analogous to thermal convective instability but which may be two orders of magnitude or more greater than strong thermal convection. Laboratory experiments in a wind-wave tank support the predictions of the theory. Recognition of this mechanism as a primary cause of Langmuir circulations explains apparent differences between observations in lakes and oceans. (Knapp-USGS)

A FIELD STUDY OF LANGMUIR CIRCULATIONS,
State Univ. of New York, Albany.
Glenn E. Myer.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 652-663, 1969. 12 p, 11 fig, 1 tab, 21 ref.

Descriptors: *Water circulation, *Lakes, *New York, *Thermal stratification, *Stratified flow, Currents (Water), Mixing, Heat transfer, Diffusion, Convection.
Identifiers: *Langmuir circulation.

To determine the thermal structure and importance of Langmuir circulations, floating temperature probes were used in Lake George, N. Y. Under thermally stable conditions Langmuir circulations transport heat downward. Langmuir circulations are a major cause of epilimnion mixing and thermocline development and decline in lakes. The Langmuir circulations appear to be coupled to the wind by some indirect mechanism. The mechanisms for this coupling which best fit field observations on Lake George are those acting as or very near the water surface. (See also W71-05561) (Knapp-USGS)

SUMMER THERMAL STRUCTURE AND CIRCULATION OF CHEQUAMEGON BAY, LAKE SUPERIOR--A FLUCTUATING SYSTEM,
Wisconsin Univ., Madison. Marine Studies Center.
R. A. Ragotzkie, W. F. Ahrnsbrak, and A. Synowiec.
Supported by a grant from the E. J. du Pont de Nemours and Company. In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 686-704, 1969. 19 p, 13 fig, 4 tab, 10 ref.

Descriptors: *Water circulation, *Bays, *Lake Superior, *Thermal stratification, *Currents (Water), Great Lakes, Seiches, Wisconsin, Limnology, Waves (Water), Winds, Surveys, Current meters.
Identifiers: *Chequamegon Bay (Lake Superior).

An extensive series of measurements of thermal structure, currents and seiches was made during July and August 1968 on Chequamegon Bay, a semi-enclosed bay of Lake Superior. Analysis of these data shows that the circulation of this bay is a fluctuating system in which water movement associated with wind-induced movements of the thermocline is the primary mechanism for water exchange between the Bay and the Lake. Superimposed on this flushing mechanism is a complex pattern of temporally and spatially varying currents associated with seiche activity in the Bay. Current measurements also suggest a weak anticlockwise general circulation. It is postulated that the physical behavior of Chequamegon Bay and its interaction with Lake Superior may be characteristic of other semi-enclosed bays of the Great Lakes. GEOCHEMICAL SYSTEMS IN ONONDAGA LAKE (CENTRAL NEW YORK STATE) COMPARED WITH THE GREAT LAKES,
Slippery Rock State College, Pa. Dept. of Geology.
Jeffrey C. Sutherland.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 357-363, 1969. 7 p, 6 fig, 18 ref. FWQA Grant WPRD 66-01-68.

Descriptors: *Water chemistry, *Clay minerals, *Lakes, Silica, Calcium, Sodium Chlorides, Phosphates, Lake Huron, Lake Erie, Great Lakes, Equilibrium, Aqueous solutions, Ion exchange, Carbonates, Kaolinite, Montmorillonite.
Identifiers: Onondaga Lake (NY).

Onondaga Lake is shallow, eutrophic, and contains unusually high concentrations of dissolved Ca, Na, Cl, SiO_2, and PO_4. Interpretations of chemical and mineralogical data tested in equilibrium models are compared with those for the Great Lakes. The average annual condition of near equilibrium with calcite and dolomite is inherited from influent streams. Lake Erie is in equilibrium with hydroxyapatite, but Onondaga Lake is oversaturated, approaching equilibrium in winter only. Whereas lower limits of silica in the North Channel and Lake Huron are probably established through dissolution of kaolinite, upper limits upon silica in Onondaga Lake may partly be a function of reaction of kaolinite to form K feldspar. Concentrations of silica in sediment-enclosed waters of the North Channel and Onondaga Lake approach equilibrium values with amorphous silica. Equilibrium between montmorillonite and kaolinite may depend upon ratios of calcium to sodium, among other factors: In carborate mineral-bearing Great Lakes sediments kaolinite approaches equilibrium with Ca montmorillonite, but in Onondaga Lake approach to equilibrium with Na montmorillonite is inferred. WIND INDUCED CIRCULATION PATTERN IN A ROTATING MODEL OF LAKE ERIE,
State Univ. of New York, Buffalo. Faculty of Engineering and Applied Sciences.
Peter J. Buechi, and Ralph R. Rumer.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 406-414, 1969. 9 p, 10 fig, 8 ref. FWQA Grant WP-00837.

Descriptors: *Water circulation, *Lake Erie, *Currents (Water), Winds, Waves (Water), Seiches, Distribution patterns, Model studies, Hydraulic models, Hydraulic similitude, Flow, Great Lakes.
Identifiers: Lake circulation.

Experimental studies to determine the effects of a prevailing westerly wind on the circulation patterns in a vertically distorted Froude model of Lake Erie were performed in a rotating laboratory that housed the model lake, all necessary instrumentation, and personnel. A vertical scale of 1:500 and a horizontal scale of 1:200,000 were used. Wind stresses were simulated using a battery of blowers. Model wind velocities could be varied from zero to 13 ft/sec. Preliminary correlation with prototype wind speeds was obtained by measuring water level changes in the eastern end of the model lake and comparing with available prototype field observations for known wind conditions. Motion picture studies with dyes serving as tracers were used in the collection of data. Comparison with earlier circulation studies performed in the absence of wind stress reveals significant changes in the overall circulation pattern and the appearance of significant differences between surface and subsurface circulation patterns. STATISTICAL ANALYSIS OF CURRENTS AT TWO NEAR-BY STATIONS IN LAKE MICHIGAN, SUMMER, 1967,
Northwestern Univ., Evanston, Ill. Dept. of Engineering Sciences; and Michigan Univ., Ann Arbor. Great Lakes Research Div.
G. E. Birchfield, and V. E. Noble.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 529-539, 1969. 11 p, 8 fig, 4 ref.

Descriptors: *Currents (Water), *Water circulation, *Lake Michigan, Sampling, Correlation analysis, Current meters, Tracking techniques, Gaging stations, Weather, Winds, Waves (Water), Great Lakes.
Identifiers: Lake currents.

Two anchored buoy stations were placed 8 mi off Sheboygan, Wisconsin, 1/2 mi apart, in approximately 100 m of water. Observations of currents at 5-min intervals near the surface and 10 m were made for about 8 days. Repeated measurements of currents using drogues were made during the interval; in addition dynamic height currents were estimated from BT soundings made in the vicinity of the stations. For motions of time-scale larger than 10-12 hr, the current meter data were closely correlated with one another. For shorter period motions the current meter data were seriously distorted. Drogue measurements were fairly consistent with the current meters, but tended to show more consistency among themselves. Dynamic height currents proved inadequate. The complexity of coastal currents is illustrated with the example of currents associated with two cold-frontal passages over the Lake. (See also W71-05561) (Knapp-USGS)
W71-05893

WAVE FORCES IN LAKE ERIE,
Michigan Univ., Ann Arbor. Dept. of Meteorology and Oceanography.
Alan L. Cole.
Supported by US Lake Survey, Army Corps of Engineers. In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 540-552, 1969. 13 p, 11 fig, 2 tab, 2 ref.

Descriptors: *Waves (Water), *Lake Erie, *Energy, *Coastal engineering, Great Lakes, Erosion, Shore protection, Data collections, Surges, Shores, Harbors, Pressure.
Identifiers: *Wave forces (Lake Erie).

Direct measurement of the pressure of Great Lakes' waves on a breakwater in Lake Erie at Lorain, Ohio was undertaken to produce data to be used in an evaluation of the applicability of existing theories to Great Lakes conditions and to provide

empirical relationships for breakwater design, ship design, and other practical needs in the Great Lakes. The East Breakwater Shorearm at Lorain, Ohio was chosen to be instrumented because of its location, orientation, type of construction and ownership. The field project was initiated in September, 1968 and was terminated by ice conditions in December, 1968, with data taken in November and December, 1968. Wave pressure decreases below the still water level as predicted by Sainflou. (See also W71-05561) (Knapp-USGS)
W71-05894

SMALL-SCALE MODEL OF THE 'THERMAL BAR',
British Columbia Univ., Vancouver. Inst. of Oceanography.
G. H. Elliott, and J. A. Elliott.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 553-557, 1969. 5 p, 3 fig, 6 ref.

Descriptors: *Thermal stratification, *Great Lakes, Stratified flow, Water circulation, Currents (Water), Water temperature, Thermocline, Limnology.
Identifiers: *Thermal bar (Great Lakes), Thermal plumes.

A two-dimensional freshwater model was used to simulate the 'thermal bar' phenomenon by heating and cooling the water through 4C. The temperature profiles were similar to observations made in the Great Lakes. The current patterns observed suggest that the 'thermal bar' is actually a thermal plume with an overriding wedge of stable water. (See also W71-05561) (Knapp-USGS)
W71-05895

INTERNAL WAVES OF THE SECOND VERTICAL MODE IN LAKE HURON,
Waterloo Univ. (Ontario). Dept. of Mechanical Engineering.
Alan M. Hale.
Supported by the Great Lakes Inst., Univ. of Toronto. In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 564-566, 1969. 3 p, 3 fig, 5 ref.

Descriptors: *Waves (Water), *Stratification, *Stratified flow, *Lakes, Great Lakes, Mathematical studies, Model studies, Interfaces, Density stratification, Currents (Water), Thermal stratification.
Identifiers: *Internal waves (Lakes).

A two-layer model is often used for the theoretical analysis of internal waves in a body of stratified fluid. Only a single mode of motion, a 'simple' oscillation of the interface (an internal wave of the first vertical mode) is predicted by this modelling. Because natural fluid bodies have a continuous density variation, corresponding theoretical analyses allow other modes of motion. One of the possible modes may be described as a pulsation of the fluid between isothermal surfaces and is called an internal wave of the second vertical mode. Experimental evidence supporting the existence of internal waves of the second vertical mode is presented. (See also W71-05561). (Knapp-USGS)
W71-05896

HYDRAULIC AND WIND-INDUCED CIRCULATION IN A MODEL OF A GREAT LAKE,
Department of Energy, Mines and Resources, Burlington (Ontario). Great Lakes Div.
J. F. Hamblin.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 567-582, 1969. 16 p, 7 fig, 10 ref.

Descriptors: *Water circulation, *Great Lakes, *Currents (Water), *Winds, Model studies, Mathematical studies, Flow, Thermal stratification, Lakes, Stratified flow, Mathematical models.
Identifiers: Wind-induced curculation (Great Lakes).

The steady state hydraulically induced circulation of a rotating lake of circular plan was studied by means of numerical solutions of the equations of fluid motion. Frictional dissipation is assumed to be accounted for by constant lateral and vertical eddy diffusivities. In a homogeneous lake of uniform depth, the circulation consists of a diffuse flow from source to sink throughout the lake. For a parabolic basin, the flow is divided into two unequal streams, each following the shoreline and having a width of approximately 10 km. Circulation due to a uniform windstress directed along a diagonal of the basin of variable depth from source to sink obscures the underlying hydraulic circulation. When two-layer stratification is taken into account, the steady state hydraulically driven circulation undergoes a marked alteration. Hydraulic flow in the upper layer assumes a configuration similar to that of the homogeneous lake of constant depth. Windstress applied to the upper layer from the source to the sink has the effect of concentrating the hydraulic circulation in a narrow stream along the shoreline of the lake to the right of the direction of flow. (See also W71-05561). (Knapp-USGS)

VISUAL WAVE OBSERVATIONS ALONG THE LAKE MICHIGAN SHORE,
United States Lake Survey, Detroit, Mich.
Paul C. Liu, and John G. Housley.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Micigan, Ann Arbor: International Association for Great Lakes Research, p 608-621, 1969. 14 p, 12 fig, 7 tab, 5 ref.

Descriptors: *Waves (Water), *Lake Michigan, *Data collections, Great Lakes, Fetch, Frequency, Wavelengths, Monitoring, On-site data collections, Storms, Winds, Statistics.
Identifiers: U. S. Coast Guard.

A program of visual observations of lake waves along the Lake Michigan shore was conducted during the autumns of 1966 and 1967. Observers at seven Coast Guard stations participated in this program. Observations were made from shore at each station at 4-hr intervals during the periods when small craft or storm warnings were displayed and included wave height, wave period, and direction of wave approach. The majority of wave heights observed along the Lake Michigan shore during the storm conditions were of the order of 1 m, and have periods were mostly between 3 and 7 sec. While higher wave heights were reported in the northern part of the Lake, the stations in the southern part tended to report longer wave periods. An average of 20% of waves observed on the east shore and 7% of the waves observed on the west shore were over 2 m in height. A study of the joint distributions of observed wave height and wave period indicated that the steepnesses of waves were generally quite high sometimes even exceeding 1:10. (See also W71-05561). (Knapp-USGS)
W71-05899

DIURNAL CHANGES IN STRATIFICATION AND DISSOLVED OXYGEN IN THE SURFACE WATERS OF LAKE MICHIGAN,
Michigan State Univ., East Lansing. Dept. of Botany; and North Carolina Univ., Chapel Hill. Dept. of Zoology.
Bruce A. Manny, and Charles A. S. Hall.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 622-634, 1969. 13 p, 7 fig, 2 tab, 35 ref.

Descriptors: *Dissolved oxygen, *Thermal stratification, *Lake Michigan, *Diurnal distribution, Respiration, Photosynthetic oxygen, Algae, Plankton, Limnology, Great Lakes, Water circulation, Mixing, Data collections, Primary productivity.
Identifiers: Diurnal DO changes.
